4

SCOPE

5

6

1 Guideline title

7

The management of lower urinary tract symptoms in men

8

1.1 Short title

9

Lower urinary tract symptoms in men

10

1 **2 Background**

2 a) The National Institute for Health and Clinical Excellence ('NICE' or 'the Institute')
3 has commissioned the National Collaborating Centre for Acute Care to develop a
4 clinical guideline on the management of lower urinary tract symptoms (LUTS) in
5 men for use in the NHS in England and Wales. This follows referral of the topic
6 by the Department of Health (see appendix). The guideline will provide
7 recommendations for good practice that are based on the best available
8 evidence of clinical and cost effectiveness.

9 b) The Institute's clinical guidelines support the implementation of National Service
10 Frameworks (NSFs) in those aspects of care for which a Framework has been
11 published. The statements in each NSF reflect the evidence that was used at the
12 time the Framework was prepared. The clinical guidelines and technology
13 appraisals published by the Institute after an NSF has been issued will have the
14 effect of updating the Framework.

15 c) NICE clinical guidelines support the role of healthcare professionals in providing
16 care in partnership with patients, taking account of their individual needs and
17 preferences, and ensuring that patients (and their carers and families, where
18 appropriate) can make informed decisions about their care and treatment.

19

3 Clinical need for the guideline

- 2 a) Lower urinary tract symptoms (LUTS) are a collection of symptoms related to
3 problems with the voiding, storage and post-micturition of urine. They generally
4 arise as a result of abnormalities or inadequate functioning of the prostate,
5 urethra, bladder or sphincters. The pathophysiology of LUTS are diverse. In men,
6 benign prostate enlargement, which is secondary to benign prostatic hyperplasia
7 and causes bladder outlet obstruction, is frequently considered to be the major
8 cause of LUTS. However, many other conditions can cause LUTS, including
9 detrusor muscle weakness or overactivity, prostatitis, urinary tract infection,
10 malignancy and neurological disease. In acknowledgement of the non-specific
11 nature of many male LUTS, this clinical guideline will advise on the effective
12 evidence-based management of male LUTS in general, with a specific focus on
13 LUTS associated with benign prostatic disease (presumed benign prostatic
14 hyperplasia).
- 15 b) LUTS in men are best categorised into voiding, storage or post-micturition
16 symptoms to help define the source of the problem. Voiding symptoms (previously
17 known as obstructive symptoms) include weak or intermittent urinary stream,
18 straining, hesitancy, terminal dribbling and incomplete emptying. Storage
19 symptoms (previously known as irritative symptoms, and currently often
20 considered as a symptom complex known as ‘overactive bladder’) include
21 urgency, frequency, urgency incontinence and nocturia. The major post-micturition
22 symptom is dribbling, which is common and bothersome. Although LUTS do not
23 usually cause severe illness, they can considerably reduce patients’ quality of life,
24 and may point to serious pathology of the urogenital tract.
- 25 c) LUTS are a major burden for the ageing male population. Approximately 30%
26 of men aged 50 and older have moderate to severe LUTS. This is a very large
27 group potentially requiring treatment. Age is an important risk factor for LUTS
28 and the prevalence of LUTS increases as men get older. Other risk factors include
29 hormonal status (presence of androgens), increased size of the prostate gland
30 and bladder decompensation. Ethnicity may also be a risk factor: men of black
31 origin seem to be more likely to need surgery for prostate enlargement than men
32 of white origin. Men of Asian origin seem to be less likely than men of white
33 origin to need surgery.
- 34 d) Because prevalence increases with age, the figure above will continue to rise with
35 increasing life expectancy and the resulting growth of the elderly population. This
36 will place increasing demands on health service resources in the coming years.
37 The past 25 years have seen an increase in the use of pharmacotherapy for
38 LUTS, with a considerable decline in surgical rates. Nevertheless, in England, for
39 the year 2003–2004, there were almost 30,000 endoscopic resections of the

1 male bladder outlet, accounting for more than 138,000 bed days. Although
2 transurethral resection of the prostate is often effective in reducing symptoms in
3 men, it is associated with considerable morbidity and a significant overall annual
4 cost. In addition, a significant proportion of men (25–30%) do not benefit from
5 prostatectomy and have poor post-surgical outcome with no improvement of
6 symptoms. Some failures can be attributed to poor surgical technique, whereas
7 others may be due to incorrect diagnosis of the cause of LUTS. Therefore, to
8 minimise the number of unnecessary operations, predicting the outcome of
9 transurethral resection of the prostate is important.

10 e) The British Association of Urological Surgeons primary care guidelines (2004)
11 include recommendations on management and referral to secondary care. There
12 are no specific recommendations on urodynamic studies. The European
13 Association of Urology guidelines (2004) recommend the routine use of
14 uroflowmetry before prostatectomy, and that pressure-flow studies should be
15 used in certain circumstances (but not routinely). According to expert opinion, most
16 UK clinicians carry out uroflowmetry and, in appropriate patients in secondary
17 care, pressure-flow studies are done before surgical intervention in units with
18 access to the equipment. However, experts agree that there is wide variation in
19 clinical practice in the UK. This is due to individual clinicians' belief in the value of
20 urodynamic studies, and also due to staffing issues and access to the technology.
21 There are many national and international guidelines concerned with the
22 management of men with LUTS; however, these vary in quality.

23 f) This NICE clinical guideline will address the variations in practice to allow
24 equitable and appropriate treatment for all affected men. There may be cost
25 savings in defining the appropriate use of suitable investigational modalities and
26 existing pharmacotherapy, and by potentially preventing unnecessary surgical
27 treatment and the costs of failed prostatectomy. However, costs incurred would
28 include the cost of equipment, carrying out the tests and associated staff time.
29 Uncertainty over the effectiveness of urodynamic studies makes it impossible to
30 estimate resource impact.

1 **4 The guideline**

- 2 a) The guideline development process is described in detail in two publications that
3 are available from the NICE website (see ‘Further information’). ‘The guideline
4 development process: an overview for stakeholders, the public and the NHS’
5 describes how organisations can become involved in the development of a
6 guideline. ‘The guidelines manual’ provides advice on the technical aspects of
7 guideline development.
- 8 b) This document is the scope. It defines exactly what this guideline will (and will not)
9 examine, and what the guideline developers will consider. The scope is based on
10 the referral from the Department of Health (see appendix).
- 11 c) The areas that will be addressed by the guideline are described in the following
12 sections.

13 **4.1 Population**

14 **4.1.1 Groups that will be covered**

- 15 a) Adult men (18 years or older) with a clinical working diagnosis of LUTS.
- 16 b) Men who have a higher prevalence of LUTS or may be at higher risk including:
- 17 • older men
- 18 • men who are of black origin.

19 **4.1.2 Groups that will not be covered**

- 20 a) Women.
- 21 b) Men younger than 18 years.

22 **4.2 Healthcare setting**

23 Primary, secondary and tertiary care settings.

24 **4.3 Clinical management**

- 25 a) The clinical and cost effectiveness, and possibly morbidity, of intervention in the
26 management of LUTS.

- 1 b) Initial diagnostic assessments of LUTS, including:
- 2 • digital rectal examination (DRE)
- 3 • symptom scores assessments
- 4 • prostate-specific antigen
- 5 • urinary flow rate
- 6 • post-void residual
- 7 • appropriate use of pressure/flow urodynamics
- 8 • cystoscopy.
- 9 c) Monitoring of chronic LUTS.
- 10 d) Non-pharmacological interventions:
- 11 • active observation ('watchful waiting')
- 12 • devices (such as catheters, pads and clamps)
- 13 • lifestyle and behavioural changes (such as diet, bladder retraining and pelvic
- 14 floor exercises).
- 15 e) Pharmacological interventions as first- and/or second-line treatment:
- 16 • 5-alpha reductase inhibitors
- 17 • alpha blockers
- 18 • anticholinergics
- 19 • other pharmacotherapeutic agents (such as phytotherapy and
- 20 phosphodiesterase inhibitors)
- 21 • combination therapy.
- 22 f) Note that guideline recommendations will normally fall within licensed indications;
- 23 exceptionally, and only if clearly supported by evidence, use outside a licensed
- 24 indication may be recommended. The guideline will assume that prescribers will
- 25 use a drug's summary of product characteristics to inform their decisions for
- 26 individual patients.
- 27 g) Surgical interventions or minimally invasive alternatives:
- 28 • transurethral electrovaporisation of the prostate
- 29 • transurethral radiofrequency needle ablation of the prostate

- 1 • all forms of laser therapy directed at the prostate, including enucleation and
2 vaporisation
- 3 • transurethral resection of the prostate, including newer forms of therapy such
4 as bipolar excision
- 5 • transurethral incision of the prostate
- 6 • open prostatectomy.
- 7 h) Combinations of the above interventions.
- 8 i) Condition-specific information, support and communication needs of patients,
9 carers and families with LUTS.
- 10 j) General advice on the appropriate evaluation and management of LUTS in men.
- 11 k) The Guideline Development Group will consider making recommendations on the
12 principal complementary and alternative interventions or approaches to care
13 relevant to male LUTS. This will include phytotherapy.
- 14 l) The Guideline Development Group will take reasonable steps to identify
15 ineffective interventions and approaches to care. If robust and credible
16 recommendations for re-positioning the intervention for optimal use, or changing
17 the approach to care to make more efficient use of resources can be made, they
18 will be clearly stated. If the resources released are substantial, consideration will
19 be given to listing such recommendations in the ‘Key priorities for implementation’
20 section of the guideline.

21 **4.4 Status**

22 **4.4.1 Scope**

23 This is the final version of the scope.

24 The NICE has published the following related guidance:

- 25 • Urinary incontinence: the management of urinary incontinence in women. NICE
26 clinical guideline 40 (2006)
- 27 • Referral guidelines for suspected cancer. NICE clinical guideline 27 (2005)
- 28 • Potassium-titanyl-phosphate (KTP) laser vaporisation of the prostate for benign
29 prostatic obstruction. NICE interventional procedure guidance 120 (2005)
- 30 • Holmium laser prostatectomy. NICE interventional procedure guidance 17 (2003)
- 31 • Transurethral radiofrequency needle ablation of the prostate. NICE interventional
32 procedure guidance 15 (2003)
- 33 • Transurethral electrovaporisation of the prostate. NICE interventional procedure
34 guidance 14 (2003).

1 NICE is in the process of producing the following related guidance:

- 2 • Prostate cancer: diagnosis and treatment. NICE clinical guideline (publication
3 expected February 2008).

4 **4.4.2 Guideline**

5 The development of the guideline recommendations will begin on 12 December 2007.

6 **5 Further information**

7 Information on the guideline development process is provided in:

- 8 • 'The guideline development process: an overview for stakeholders, the public and
9 the NHS'
- 10 • 'The guidelines manual'.

11 These booklets are available as PDF files from the NICE website
12 (www.nice.org.uk/guidelinesmanual). Information on the progress of the guideline will
13 also be available from the website.

14 **6 Referrals from the Department of Health**

15 The Department of Health asked the Institute:

16 'To prepare a clinical guideline on the management of benign prostatic hyperplasia.'

17 'To prepare a guideline on the assessment, investigation, management and onward
18 referral of men with lower urinary tract symptoms (including male incontinence) within
19 primary care.'

20

Appendix B – Declarations of interest

1 Declarations of interests

1.1 Introduction

All members of the GDG and all members of the NCGC-ACC staff were required to make formal declarations of interest at the outset, and these were updated at every subsequent meeting throughout the development process.

1.2 Declarations of interests of the GDG members

1.2.1 Chris Chapple (Chair)

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	CC declared a personal pecuniary interest, his attendance in National and International conferences for BAUS, EAU and AUA. He declared a personal pecuniary interest in private practice. He declared that he knew of no personal family interest. He declared his non-personal pecuniary interest, consultancy and research honoraria up to 6 months age from Allergan, AMS, Astellas, Novartis, Pfizer and UCB – this was put into the department to provide funding for a researcher. He declared a personal non-pecuniary interest as principal investigator and author on pharmaceutical sponsored papers. He is a member of the committee of the BAUS section of female and functional urology and the Adjunct Secretary General of EAU- responsible for their educational activities. He has written books on the subject of BPH/LUTS. He is editor in chief of the Neurourology and Urodynamics journal (official journal of ICS and SUFU).
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	CC declared a personal pecuniary interest, his attendance in National and International conferences for ICS.
Fifth GDG Meeting (6 th June 2008)	No change
Sixth GDG Meeting (14 th July 2008)	No change
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	No change
Eleventh GDG Meeting (23 rd February 2009)	CC declared a non-personal pecuniary interest as a consultant for Astellas, Pfizer, Allergan, Xention, Ono, Recordati and Ranbaxy. He declared a personal non-

GDG meeting	Declaration of Interests
	pecuniary interest that any concerns over his views should be expressed at any stage. He declared that he knew of no personal pecuniary interest or personal family interest, above those declared at the previous meeting.
Twelfth GDG Meeting (25 th March 2009)	No change
Thirteenth GDG Meeting (1 st May 2009)	No change
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	CC declared a personal non-pecuniary interest; he spoke as invited speaker at Astellas symposium at the British Association of Urological Surgeons meeting. He was a speaker at a symposium provided by the European Association of Urology on behalf of Astellas. He was a speaker at a symposium organised by Allergan at the American urology Association meeting. He declared that he had no personal pecuniary interest, personal family interest or non-personal pecuniary interest above those previously declared.
Actions	None required.

1
23 **1.2.2 Angela Billington**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	She did not attend this meeting.
Second GDG Meeting (13 th December 2007)	AB declared a personal pecuniary interest, Pfizer education support committee. AB did not declare a personal family interest. AB did not declare a non-personal pecuniary interest. She did not declare a personal non-pecuniary interest.
Third GDG Meeting (17 th March 2008)	She did not attend this meeting.
Fourth GDG Meeting (30 th April 2008)	AB declared a personal pecuniary interest, attended conferences for Pfizer, Coloplast, Rochester Medical and Bard. Faculty for Pfizer sense of leadership conference and CARE program for nurses. She did not declare a personal family interest, non-personal pecuniary interests or personal non-pecuniary interest.
Fifth GDG Meeting (6 th June 2008)	She did not attend this meeting.
Sixth GDG Meeting (14 th July 2008)	AB declared a personal pecuniary interest; she is involved in an educational package for Pfizer and educational symposium for Coloplast. Articles for nursing press on catheters. She had dinner courtesy of Pfizer at the ICI meeting. She did not declare a personal family interest, non-personal pecuniary interest or personal non-pecuniary interest.
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	She did not attend this meeting
Ninth GDG Meeting (27 th November 2008)	No change

GDG meeting	Declaration of Interests
Tenth GDG Meeting (16 th January 2009)	No change
Eleventh GDG Meeting (23 rd February 2009)	No change
Twelfth GDG Meeting (25 th March 2009)	She did not attend this meeting
Thirteenth GDG Meeting (1 st May 2009)	No change
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	No change
Actions	During both the 14 th GDG on the 8 June 2009 and the 15 th GDG on the 29 June 2009, The Chair noted that AB had personal pecuniary interests and required AB to be present in an observatory role during the discussion of the pharmacologic recommendations.

1

2 **1.2.3 Paul Joachim**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	PJ did not declare a personal pecuniary interest or personal family interest. He declared a non-personal pecuniary interest, trustee of Incontact, a charity that benefits from grants from the industry. He declared a personal non-pecuniary interest, trustee of Incontact (as above) Chair of the patient advisory board. He declared that he has had personal and family experience of symptoms.
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	No change
Fifth GDG Meeting (6 th June 2008)	No change
Sixth GDG Meeting (14 th July 2008)	No change
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	No change

GDG meeting	Declaration of Interests
Eleventh GDG Meeting (23 rd February 2009)	No change
Twelfth GDG Meeting (25 th March 2009)	No change
Thirteenth GDG Meeting (1 st May 2009)	No change
Fourteenth GDG Meeting (8 th June 2009)	PJ declared that his interests have not changed, but he informed the group that 'Incontact' had changed its name to 'The Bladder and Bowel Foundation' in September 2008.
Fifteenth GDG Meeting (29 th June 2009)	No change
Actions	None required

1

2 **1.2.4 Malcolm Lucas**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	He did not attend this meeting
Second GDG Meeting (13 th December 2007)	He did not attend this meeting
Third GDG Meeting (17 th March 2008)	ML declared a personal pecuniary interest; I have received lecture fees from Pfizer, UCB Pharma and Astellas within the last 12 months and sponsorship to attend national and international meetings also from Pfizer, Gynecare and AMS. I am not involved in private practice and I am not now accepting invitations to serve on advisory boards. Any current income from lecturing will be payable to a research fund which pays expenses for research fellow and nurses. He did not declare a personal family interest. He declared a non-personal pecuniary interest, I am Principle local investigator for trials with Astellas, Plethora and Bioxell and Lead investigator for trials with Astra. All income goes to Clinical Research Unit, Swansea NHS Trust. He declared a personal non-pecuniary interest, current chairman of Section of Female and Reconstructive Urology, BAUS.
Fourth GDG Meeting (30 th April 2008)	No change
Fifth GDG Meeting (6 th June 2008)	No change
Sixth GDG Meeting (14 th July 2008)	No change
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	He did not attend this meeting
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	No change

GDG meeting	Declaration of Interests
Eleventh GDG Meeting (23 rd February 2009)	No change
Twelfth GDG Meeting (25 th March 2009)	ML declared a non-personal pecuniary interest of departmental research fund receiving income from the UK Continence Society Conference April 2009. The primary source of income in this conference derives from healthcare companies (pharmaceutical and device manufactures). He declared that he knew of no personal pecuniary interest, personal non-pecuniary interest or personal family interest, above those declared at the previous meeting.
Thirteenth GDG Meeting (1 st May 2009)	ML declared a non-personal pecuniary interest of the clinical research unit receiving research income from Astra tech, Pfizer and Astellas. He declared that he knew of no personal pecuniary interest, personal non-pecuniary interest or personal family interest, above those declared at the previous meeting.
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	He did not attend this meeting.
Actions	None required

1

2

1.2.5 Roy Latham

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	RL declared a personal pecuniary interest, he acted as a Lay Member on an Invited Service Review carried out by the Royal College of Physicians (July 07). He received a fee for this. He did not declare a personal family interest or non-personal pecuniary interest. He declared a personal non-pecuniary interest, he is personally affected by BPH/LUTS as a patient and as the relative/friend of affected people.
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	No change
Fifth GDG Meeting (6 th June 2008)	No change
Sixth GDG Meeting (14 th July 2008)	No change
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	He did not attend this meeting

GDG meeting	Declaration of Interests
Eleventh GDG Meeting (23 rd February 2009)	He did not attend this meeting
Twelfth GDG Meeting (25 th March 2009)	No change
Thirteenth GDG Meeting (1 st May 2009)	No change
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	No change
Actions	None required

1

2 **1.2.6 Thomas Ladds**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	He did not attend meeting
Second GDG Meeting (13 th December 2007)	He did not attend meeting
Third GDG Meeting (17 th March 2008)	TL declared a personal pecuniary interest, regular attendance at national and international conferences. BAUS, BAUN, EAU and AUA. Advisory board member for Bard UK Ltd – January 2008. He did not declare a personal family interest or non-personal pecuniary interest. He declared a personal non-pecuniary interest, member and current president of British Association of Urological Nurses (BAUN). Ex officio member BAUS Council Editorial Board member of International Journal of Urological Nursing and Urology News.
Fourth GDG Meeting (30 th April 2008)	TL declared a personal pecuniary interest, sponsorship to attend EAU from Bayer. Lecture fee from Astra Zenecu Marhcin in 2008.
Fifth GDG Meeting (6 th June 2008)	He did not attend this meeting
Sixth GDG Meeting (14 th July 2008)	TL declared that he knew of no personal pecuniary interest, personal family interest or personal non-pecuniary interest. He declared a non-personal pecuniary interest, lecture fees for Astrazeneca and Coloplast Ltd, which were paid to departmental charitable research fund.
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	He did not attend this meeting
Tenth GDG Meeting (16 th January 2009)	TL declared a personal pecuniary interest, that he has notified his NHS employer, Central Manchester University Hospitals NHS Foundation Trust that he wished to terminate his contract with them on 27 th March 2009. He is in the process of setting up a limited company, TL Consulting Ltd, of which he will be the director and sole

GDG meeting	Declaration of Interests
	shareholder; he will be employed there from April 1 2009. TL Consulting Ltd. has entered into a contract with ProstaLund Operations AB of Sweden to supply services, including advising them on clinical issues and potential business activities in the UK and overseas. This contract will be operational from April 1 2009. ProstaLunc AB currently develops, manufacture and supply equipment, consumables and software in the field of microwave thermotherapy for BPH. TL Consulting may also negotiate and enter into contracts with other suppliers in urology pharmaceutical and medical technical sectors in the future. He declared that he knew of no non-personal pecuniary interest, personal non-pecuniary interest or personal family interest, above those declared at the previous meeting.
Eleventh GDG Meeting (23 rd February 2009)	TL withdrew from the GDG due to new interests declared in the 10 th GDG meeting.
Actions	None required

1

2 **1.2.7 James N'Dow**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	JN declared a personal pecuniary interest, principle investigator (PI) on a clinical trial with payment per patient going to the urology department. Involved in private practice. He is a member of BAUS Academic Section. He did not declare a personal family interest. He declared a non-personal pecuniary interest, PI of commissioned research with University of Aberdeen by CYTOSYSTEMS on evaluation of a urinary diagnostic marker for bladder cancer. He declared a personal non-pecuniary interest; he led HTA commissioned research on systematic review of surgical treatments of BPH (in press).
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	JN declared a non-personal pecuniary interest, principle investigator (PI) on a clinical trial with payment per patient going to the urology department.
Fifth GDG Meeting (6 th June 2008)	He did not attend this meeting
Sixth GDG Meeting (14 th July 2008)	He did not attend this meeting
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	He did not attend this meeting
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	No change
Eleventh GDG Meeting (23 rd February 2009)	No change

GDG meeting	Declaration of Interests
Twelfth GDG Meeting (25 th March 2009)	He did not attend this meeting
Thirteenth GDG Meeting (1 st May 2009)	No change
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	No change
Actions	None required

1

2 **1.2.8 Jon Rees**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	JR declared a personal pecuniary interest, involved in private urological practice. He declared that he knew of no personal family interest, non-personal pecuniary interest or personal non-pecuniary interest.
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	No change
Fifth GDG Meeting (6 th June 2008)	No change
Sixth GDG Meeting (14 th July 2008)	No change
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	He did not attend this meeting
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	He did not attend this meeting
Eleventh GDG Meeting (23 rd February 2009)	No change
Twelfth GDG Meeting (25 th March 2009)	He did not attend this meeting
Thirteenth GDG Meeting (1 st May 2009)	No change

GDG meeting	Declaration of Interests
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	No change

2 **1.2.9 Mark Speakman**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	MS declared a personal pecuniary interest, he is involved in giving lectures for drug companies at national and international meetings in last 12 months (Astellas, GSK, Boehringer Ingelheim, Pfizer). No new consulting work and new projects declined for duration of guideline. Involved in private practice. He did not declare a personal family interest. He declared a non-personal pecuniary interest, investigator in BPH trials (Astellas, Bayer, GSK, Pfizer, MSD, Allergan). None in last 12 months (sponsorship). Previous research sponsorship from Yamanouchi and MSD in last 5 years. He declared a personal non-pecuniary interest, his clear opinion - author of BAUS BPH Guideline 2004. Author of a number of peer-reviewed LUTS/BPH papers.
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	MS declared a personal non-pecuniary interest, he is a member of the editorial board for European Urology.
Fifth GDG Meeting (6 th June 2008)	No change
Sixth GDG Meeting (14 th July 2008)	MS declared a personal pecuniary interest, single lecture (debate) on anticholinergics for Astellas. He declared that he knew of no personal family interest, non-personal pecuniary interest or personal non-pecuniary interest, above those declared at the previous meeting.
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	He did not attend this meeting
Eleventh GDG Meeting (23 rd February 2009)	No change
Twelfth GDG Meeting (25 th March 2009)	MS declared a non-personal pecuniary interest of future research studies planned with Allergan and GSK. He declared a personal non-pecuniary interest as national investigator for new LUTS/BPH Registry for the European Association of Urology. He declared that he knew of no personal pecuniary interest or personal family

GDG meeting	Declaration of Interests
	interest, above those declared at the previous meeting.
Thirteenth GDG Meeting (1 st May 2009)	He did not attend this meeting.
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	MS declared a non-personal pecuniary interest, new supported research studies with Allergan, Astellas and GSK. He declared participation in EAU LUTS/BPH database. He declared that he knew of no personal pecuniary interest, personal family interest or personal non-pecuniary interest, above those declared at the previous meeting.
Actions	None required

2 **1.2.10 Julian Spinks**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	JS declared a personal pecuniary interest, he is a member of advisory boards on LUTS and received honoraria from Boehringer Ingelheim (March 07). He has attended advisory boards on Restless legs syndrome organised by RLS UK with payment from Boehringer Ingelheim. He has been paid for attendance at a focus group on faecal incontinence by Continence UK (Nov 07). He has been paid to speak and chair meetings by Astellas, BMS and ALK. He is a paid member of the editorial boards of Continence UK. He has received payment for attending focus meetings on child growth hormone. He did not declare a personal family interest of non-personal pecuniary interest. He declared a personal non-pecuniary interest, member of the strategy board of Incontact, Chairman of the local division of the BMA and board member of RLS UK.
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	JS declared a personal pecuniary interest, I have received sponsorship to attend the EAU congress in Milan from Pfizer. I have received speaker fees to speak at a conference from Pfizer on GPs and OAB. He is a member of advisory boards on LUTS and received honoraria from Boehringer Ingelheim (March 07). He has attended advisory boards on Restless legs syndrome organised by RLS UK with payment from Boehringer Ingelheim. He has been paid for attendance at a focus group on faecal incontinence by Continence UK (Nov 07). He has been paid to speak and chair meetings by Astellas, BMS and ALK. He is a paid member of the editorial boards of Continence UK. He has received payment of attending focus meetings on child growth hormone. He did not declare a personal family interest of non-personal pecuniary interest. He declared a personal non-pecuniary interest, member of the strategy board of Incontact, Chairman of the local division of the BMA and board member of RLS UK.
Fifth GDG Meeting (6 th June 2008)	No change
Sixth GDG Meeting (14 th July 2008)	No change
Seventh GDG Meeting (8 th September 2008)	No change

GDG meeting	Declaration of Interests
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	JS declared a personal non-pecuniary interest, he attended a planning meeting for the “Sense of Leadership” organised by Pfizer. He declared that he knew of no personal pecuniary interest, personal family interest or non-personal pecuniary interest, above those declared at the previous meeting.
Eleventh GDG Meeting (23 rd February 2009)	No change
Twelfth GDG Meeting (25 th March 2009)	No change
Thirteenth GDG Meeting (1 st May 2009)	JS declared that he had no current personal pecuniary interests. He declared that he knew of no non-personal family interest, personal non-pecuniary interest or personal family interest, above those declared at the previous meeting.
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	No change
Actions	During the 12 th GDG on the 25 th March 2009, JS was only present as an observer for the presentations on medical interventions and did not participate in discussion due to previously declared interest.

2 **1.2.11 William Turner**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	WT declared a personal pecuniary interest, private practice in urology. He did not declare a personal family interest. He declared a non-personal pecuniary interest, he is the principal local investigator in clinical trials with Allergan (not yet opened), Dianippo Sumuto, Yamanouchi (now Astellas), Schwarz Pharma. He is the principal local investigator in clinical trial with Novartis 2005-6. He declared a personal non-pecuniary interest, executive committee member section of female and reconstructive urology, British Association of Urological Surgeons. Author of papers, chapters and books on urology. Member of NICE Topic Selection Panel and Technology Appraisal Committee.
Second GDG Meeting (13 th December 2007)	No change
Third GDG Meeting (17 th March 2008)	No change
Fourth GDG Meeting (30 th April 2008)	No change
Fifth GDG Meeting (6 th June 2008)	No change

GDG meeting	Declaration of Interests
Sixth GDG Meeting (14 th July 2008)	No change
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	No change
Eleventh GDG Meeting (23 rd February 2009)	No change
Twelfth GDG Meeting (25 th March 2009)	No change
Thirteenth GDG Meeting (1 st May 2009)	No change
Fourteenth GDG Meeting (8 th June 2009)	No change
Fifteenth GDG Meeting (29 th June 2009)	He declared a non-personal pecuniary interest; he stated that his participation in the clinical trial with Allergan never materialised. He declared that he knew of no personal pecuniary interest, personal family interest or personal non-pecuniary interest above those declared at the previous meeting.
Actions	None required.

1

2 **1.2.12 Adrian Wagg**

GDG meeting	Declaration of Interests
First GDG meeting (12 th December 2007)	He did not attend this meeting
Second GDG Meeting (13 th December 2007)	AW declared a personal pecuniary interest, Astellas pharmaceutical – consultant. Pfizer – occasional consultant. He did not declare a personal family interest. He declared a non-personal pecuniary interest, fees for lectures/writing to research healthcare commission – research fund for Pfizer, Astellas, UCB. He declared a personal non-pecuniary interest, Chairman of trustees of the Continence Foundation and Vice Chairman trustees of Incontact. Researcher for Astellas. Plethora, Boehringer Ingelheim –Lilly. Associate Director CEEU, Royal College of Physicians. He is the National leader for audit of the Continence care.
Third GDG Meeting (17 th March 2008)	He declared a non-personal pecuniary interest, he declared a Pfizer research study, European CI and UK PI.
Fourth GDG Meeting (30 th April 2008)	AW declared a personal pecuniary interest, Astellas pharmaceutical – consultant. Pfizer – occasional consultant. Pfizer pharmaceutical advisory board. Sense of leadership course for Pfizer. SCA conference. Lecture fees from Astellas and telephone symposium on LUTS on geriatric medicine. He did not declare a personal family interest. He declared a non-personal pecuniary interest, fees for lectures/writing to research healthcare commission – research fund for Pfizer,

GDG meeting	Declaration of Interests
	Astellas, and UCB. Pfizer research study, European C.I. and UK principal investigator. BUPA grant for research £13K. Sponsorship to EAU by Astellas. He declared a personal non-pecuniary interest, Vice-chairman of the Continence Foundation and Incontact (merged). Researcher for Astellas. Plethora, Boehringer Ingelheim –Lilly. Associate Director CEEU, Royal College of Physicians. He is the National leader for audit of the Continence care. Papers for Pharma funded studies.
Fifth GDG Meeting (6 th June 2008)	AW declared a personal pecuniary interest, since last declaration, speaker for Pfizer at launch meeting for Fesoterodine. Astellas pharmaceutical – consultant. Pfizer – occasional consultant. Pfizer pharmaceutical advisory board. Sense of leadership course for Pfizer. SCA conference. Lecture fees from Astellas and telephone symposium on LUTS on geriatric medicine. He did not declare a personal family interest. He declared a non-personal pecuniary interest, fees for lectures/writing to research healthcare commission – research fund for Pfizer, Astellas, and UCB. Pfizer research study, European C.I. and UK principal investigator. BUPA grant for research £13K. Sponsorship to EAU by Astellas. He declared a personal non-pecuniary interest, Vice-chairman of the Continence Foundation and Incontact (merged). Researcher for Astellas. Plethora, Boehringer Ingelheim –Lilly. Associate Director CEEU, Royal College of Physicians. He is the National leader for audit of the Continence care. Papers for Pharma funded studies.
Sixth GDG Meeting (14 th July 2008)	AW declared a non-personal pecuniary interest, Chairman of Bladder Master class for Astellas Pharma. He declared a personal non-pecuniary interest; he had dinner courtesy of Pfizer at the ICI meeting in Paris and BAUS. He declared that he knew of no personal pecuniary interest or personal family interest, above those declared at the previous meeting.
Seventh GDG Meeting (8 th September 2008)	No change
Eighth GDG Meeting (15 th October 2008)	No change
Ninth GDG Meeting (27 th November 2008)	No change
Tenth GDG Meeting (16 th January 2009)	AW declared a non personal pecuniary interest, donation to fellows research fund from Astellas. He declared that he knew of no personal pecuniary interest, personal family interest or personal non-pecuniary interest, above those declared at the previous meeting.
Eleventh GDG Meeting (23 rd February 2009)	He did not attend this meeting
Twelfth GDG Meeting (25 th March 2009)	He did not attend this meeting
Thirteenth GDG Meeting (1 st May 2009)	No change
Fourteenth GDG Meeting (8 th June 2009)	AW declared a personal pecuniary interest and had received fees for a talk from Glaxo, he did not declare a personal family interest. He declared a non-personal pecuniary interest for research from Pfizer. He declared a personal non-pecuniary interest that a donation from Astellas for filming.
Fifteenth GDG Meeting (29 th June 2009)	AW declared a non-personal pecuniary interest, Pfizer talk at BAUS – payment into the department. He declared that he had no personal pecuniary interest, personal family interest or personal non-pecuniary interest above those previously declared.
Actions	During both the 14 th GDG on the 8 June 2009 and the 15 th GDG on the 29 June 2009, The Chair noted that AW had personal pecuniary interests and required AW

GDG meeting	Declaration of Interests
	to be present in an observatory role during the discussion of the pharmacologic recommendations.

1

2 **1.3 Personal pecuniary interests**

3 ML, MS and CC personal pecuniary interests that were deemed significant conflicts of
4 interest had expired before medical intervention recommendations were discussed in the
5 10th GDG meeting on the 16th January 2009. Further details of the GDG meetings can
6 be found in the minutes on the [NICE website](#).

Appendix C – Search Strategies

Overview of Search Strategies

Search Strategies

Searches were constructed by using the following groups of terms. These groups are expanded in full in Section 1.2 below.

All searches were run in Medline, Embase and Cochrane Library. Additionally Cinahl and PsychINFO were searched where this was deemed appropriate. Economic searches were conducted in Medline, Embase, NHS EED and the HTA (Health Technology Reports) database from the Cochrane Library. Additionally in HEED (Health Economic Evaluations Database).

LUTS	Lower urinary tract symptoms
M/F	Male/female
N	Total number of patients randomised
NA	Not Applicable
NR	Not reported
OAB	Overactive bladder
PFMT	Pelvic floor muscle training
PMD	Post micturition dribble
PPP	Purchasing Power Parities
PSA	Prostate specific antigen
PVM	Post-void milking
PVP	Photoselective vaporisation of the prostate
PVR	Post voidal residual
QALY	Quality-Adjusted Life Years
Q_{max}	Maximum urinary flow rate
QoL	Quality of life
RBC	Red blood cells
RCT	Randomised controlled trial
RR	Relative risk

SA	Sensitivity Analysis
SD	Standard Deviation
SE	Standard Error
Sig	Statistically significant at 5%
TEAP	Transurethral ethanol ablation of the prostate
TUIP	Transurethral incision of the prostate
TUMT	Transurethral microwave thermotherapy
TUNA	Transurethral needle ablation
TURP	Transurethral resection of the prostate
TUVP	Transurethral vaporisation of the prostate
TUVRP	Transurethral vaporisation resection of the prostate
TVP	Transurethral electroVaporisation of the Prostate
TWOC	Trial Without Catheter
UI	Urinary incontinence
UTI	Urinary Tract Infection
Vs	Versus
WW	Watchful Waiting

1 Evidence Table 1: Diagnostic accuracy for urinalysis

Study details	Patients	Diagnostic tools	Measure of Disorders	Results	Comments
Ezz et al., 1996 ⁸⁵ Study design: Cross sectional study Evidence level: Level-2 study (II) Duration of follow-up: NR. Tests carried out over 2 visits.	Patient group: Consecutive men at one outpatient department (Department of Urology, Nijmegen, The Netherlands) with BPE and LUTS, either irritative or obstructive. Exclusion criteria: Patients excluded from further assessment for BPH once a prostate carcinoma suspected. All patients N: 750 Av Age (range): 64 years (40-85) Drop outs: 0	Assessment tool under investigation: Urinalysis by dipstick readings from clean mid-stream specimen, If revealed erythrocytes urine sediment microscopy was completed. Sediment grading completed by number of red blood cells (RBC): Grade 1 = 0 RBC Grade 2 = 1-5 RBC Grade 3 = 6-10 RBC Grade 4 = 10+ RBC Results: Grade 1: 516 (68.8%) Grade 2: 207 (27.2%) Grade 3: 15 (2%) Grade 4: 12 (1.6%) Gold standard: Cystoscopy and histology. Additional tests: All patients underwent: History, IPSS, physical examination with Digital rectal examination, biochemistry (PSA and serum creatinine), urine culture and cytology, trans rectal ultrasonography, plain abdominal X-ray, renal ultrasound, flexible cystoscopy, flow, post void residual (PVR) and urodynamic investigations.	Bladder tumours	Grade 1: 1/516 (0.2%) Grade 2, 3 & 4: 2/234 (0.9%) Grade 2: 2/207 Grade 3: 0/15 Grade 4: 0/12 Sensitivity 66.7% Specificity 68.9% PPV 0.9% NPV 99.8% Prevalence 3/750 (0.4%) Positive LR 2.15 Negative LR 0.48 Pre-test Odds (CI 95%) 0.004(0-0.01) Post-Test Odds +ve result 0.01 Post-Test Odds -ve result 0.01	Funding: NR. Limitations: Cystoscopy performed on second visit after initial tests. Additional tests: Correlation of grades of RBC to age, prostate volume, IPSS, residual urine and outlet obstruction. Papillary lesion and dilatation were reported. One renal tumour was reported. Notes: All patients with positive dipstick readings were found to have red cells on microscopy. Sensitivity and specificity values calculated by NCGC using no RBC found (negative) compared to any RBC (positive). All values calculated to 1d.p.
			Urinary tract infection by urine culture	Grade 1: 7/516 (1.4%) Grade 2, 3 & 4: 10/234 (4.3%) Grade 2: 9/207 Grade 3: 0/15 Grade 4: 1/12 Sensitivity 58.8% Specificity 69.4% PPV 4.3% NPV 98.6% Prevalence 17/750 (2.3%) Positive LR 1.9 Negative LR 0.6 Pre-test Odds (CI 95%) 0.02 (0.01-0.03) Post-Test Odds +ve result 0.04 Post-Test Odds -ve result 0.03	
			Urinary calculi (Stones) by abdominal X-ray	Grade 1: 35/516 (6.8%) Grade 2, 3 & 4: 14/234 (6.0%) Grade 2: 12/207 Grade 3: 1/15 Grade 4: 1/12 Sensitivity 28.6% Specificity 68.6%

Study details	Patients	Outcomes			Analysis conducted	Results	Comments	
Laguna et al. 2002 ¹⁵⁷ Study design: Cohort Duration of follow-up: Minimum of 1 year. Evaluated every 3 months during year 1 and every 6 months in year 2 and thereafter	Patient group: Consecutive patients treated with transurethral thermotherapy Setting: Secondary care, Netherlands Interventions: transurethral thermotherapy Inclusion criteria: - Treated with transurethral thermotherapy between February 1992 to June 1999, when data were available on pre-treatment determination of PSA, free uroflowmetry, voided and post-void residual urine, ultrasound measurement of prostate volume, and IPSS scores. Exclusion criteria: - Previously treated with transurethral thermotherapy, medical therapy or manipulation of the lower urinary tract interfering with baseline PSA. - Neurogenic or systemic disorder that may have impaired bladder function. All patients N: 404 M/F: 404/0 Age (mean, range): 66.3 (44.8-89.7) Drop outs: 16/404, 388 analysed		Pre-treatment	Change at 12 months	Linear regression: Change in IPSS vs. pretreatment PSA	Spearman r: -0.004 “linear regression coefficient”: -0.04 P value: 0.58	Funding: not stated Limitations: - Patients received surgical treatment (TUMT) - “Retreated patients”, analysed as having unchanged values at 12 months - Report: “no relevant linear correlation was noted for baseline PSA with changes in IPSS, QoL or Qmax.” Additional outcomes: - Values for a subgroup of patients, who have similar inclusion criteria for Djavan 2004 was reported. Notes: - Seems to address the question of “does baseline PSA predict TUMT surgery outcomes”? - Retrospective study, on “prospectively collected data”.	
		Age (years):	66.3 (44.8-89.7)	-				
		PSA (ng/MI):	5.3 (0.1-45)	-				
		IPSS:	19.1 (3-35)	9.4(0-32)		Linear regression: Change in QoL vs. pretreatment PSA		Spearman r: -0.135 “linear regression coefficient”: -0.04 P value: 0.01
		QoL (IPSS)	3.9(0-6)	1.9(0-5)				
		Prostate volume, PV (cm3)	57.7(25-178) 18 (11-31)	-		Linear regression: Change in Qmax vs. pretreatment PSA		Spearman r: 0.105 , “linear regression coefficient”: 0.105 P value: 0.1
		Qmax (mL/s):	9.4 (2-19.9)	14.6(2.4-50.3)				
		Voided vol (ml)	226(22-763)					
		Post-void vol (ml)	86(0-755)			Mann Whitney test: Baseline PSA vs. these outcomes at 1 year - IPSS>7 vs. less - Qmax >12 vs. less - QoL 1 or 2 (or 1 or 0)		Box and whisker plots shown, reported as “no association”
		All values reported were mean (range), unless otherwise specified

Study details	Patients	Interventions	Outcome measures	Effect size	Comments
<p>Bales et al., 2000²²</p> <p>Study design: RCT</p> <p>Evidence level: 1+</p> <p>Duration of follow-up: 6 months after surgery</p> <p>Outcome assessment was masked</p>	<p>Patient group: Men with stages T1c-T2c prostate cancer who were to undergo radical retropubic prostatectomy by a single surgeon</p> <p>Inclusion criteria: Men with stages T1c-T2c prostate cancer who were to undergo radical retropubic prostatectomy by a single surgeon. None of the men had undergone transurethral resection of the prostate or had pre-existing neurologic disease.</p> <p>Exclusion criteria: See above, exclusion criteria not specifically stated.</p> <p>All patients N: 100 Drop outs: 3</p> <p>Group 1: N: 50 Age (mean): 59.3 Drop outs: 3</p> <p>Group 2: N: 50 Age (mean): 60.9 Drop outs: 0</p>	<p>Group 1: Biofeedback 45-minute session with a nurse trained in biofeedback techniques 2 to 4 weeks prior to radical prostatectomy. Patients instructed how to perform graded PFMT using biofeedback. Surface electrodes were used to assess muscle strength and contractions of 5 to 10 seconds, and 10 to 15 repetitions were performed. Patients advised to practice these exercises 4/day until their surgery.</p> <p>Group 2: Control Patients underwent radical prostatectomy without any biofeedback training. These patients received only written and brief verbal instructions on how to perform PFMT to isolate the muscle that starts and stops urine flow and to practice contractions 4/day with 10 to 15 repetitions. Patients were given written instructions and briefly reviewed these instructions with a nurse.</p> <p>All patients: Postoperatively, the urethral catheter was removed approximately 2 weeks following surgery in both groups. Patients in both groups were encouraged to perform pelvic muscle strengthening exercises 4/day after catheter removal. No patient in either group received adjuvant radiation therapy or hormonal therapy within 6 months following surgery.</p>	<p>Incidence of urinary continence at 6 months post op.</p>	<p>Group 1: 44/47 (94%) Group 2: 48/50 (96%) p value: 0.60</p>	<p>Funding: NR</p> <p>Limitations: This study is poorly reported: Method of randomisation and allocation concealment not described, there is insufficient information about patients' baseline characteristics, no description of sample size calculation. Assessments methods could be unreliable. Other limitations stated by authors:</p> <ul style="list-style-type: none"> - no effort was made to assess pelvic muscle floor strength prior to surgery - incidence of incontinence in Group 2: was very low - patients received only one preoperative biofeedback session. - subtle differences in results might have been detected if more rigorous measures of incontinence had been used, such as weighted pad testing. No objective measurement of continence was used. <p>Notes: Patients wearing one pad or less per day were considered to be continent. Those using two or more pads per day were considered incontinent.</p>
			<p>Incidence of urinary continence at 3 months post op</p>	<p>Group 1: 27/47 Group 2: 31/50 p value: 0.64</p>	
			<p>Proportion of still incontinent at 3 months (ITT analysis)</p>	<p>Group 1: 23/50 Group 2: 19/50 p value: NR</p>	
			<p>Proportion of still incontinent at 6 months (ITT analysis)</p>	<p>Group 1: 6/50 Group 2: 2/50 p value: NR</p>

<p>Floratos et al., 2002⁹³</p> <p>Study design: RCT</p> <p>Evidence level: 1+</p> <p>Duration of follow-up: 6 months</p>	<p>Patient group: Patients undergoing radical retropubic prostatectomy for localised prostate cancer.</p> <p>Setting: multi-centre. Greece and Netherlands</p> <p>Inclusion criteria: Patients with objectively confirmed urinary incontinence, no significant perioperative complications (ureteric or rectal injury, urine leakage from anastomosis, thrombo-embolism), no history of preoperative incontinence and pelvic or lower urinary tract operations, no psychiatric history, a recognised ability to participate in a learning programme, good general condition and willingness to participate in the study.</p> <p>All patients N: 42 Age (mean ± SD): Drop outs: Unclear</p> <p>Group 1: N: 28 Age (mean ± SD): 63.1 +/- 4 Received Oxybutynin: n=3</p> <p>Group 2: N: 14 Age (mean ± SD): 65.8 +/- 4.3 Received Oxybutynin: n=2</p>	<p>Group 1: Biofeedback Patients referred to a specialist in physical therapy and rehabilitation to have 15 sessions of electromyographic (EMG) biofeedback (2 channel Totem Biofeedback, BEAC, Italy) 3/week of 30 min duration each. During the initial 2/3 sessions, a strong emphasis was placed on the specificity of muscle contraction. During the sessions the exercises were designed to increase the power, endurance and coordination of the pelvic floor muscles. In parallel, patients practised 50-100 exercises daily at home.</p> <p>Group 2: Control Patients were taught how to contract their pelvic muscles without contracting abdominal muscles simultaneously. Patient was placed in the lateral decubitus position and the instructor inserted index finger into patient's rectum to check for simultaneous contraction whilst palpating the abdominal muscles. Verbal feedback used to instruct the patient how to correctly and selectively contract the anal sphincter while. Patients received an informative leaflet with these instructions. Home practise comprised 80-100 exercises daily, divided in four sessions of 20-25 exercises each. The duration of each constriction was 3-5 s with submaximal strength (70%) and relaxation period of 6-10 s between the exercises. Initially patients practised these exercises while supine but later when sitting and standing. After the first month patients were encouraged to practise the exercises during normal daily activities, including movements that provoked incontinence.</p>	<p>Mean urine loss as assessed by the 1-h pad test Patients were evaluated at 1,2, 3 and 6 months of treatment using 1-h pad test. For the best intra- and inter-patient estimates in the pad test, a special type of 'pocket pad' was used which covered only the penis, thus reducing the interference from sweat on the pad weight gained during the test.</p> <p>Mean no. pads/ day Patients were evaluated subjectively with a questionnaire (to determine the number and extent of incontinence episodes, number of pads used per day, and any LUTS).</p> <p>Number of men still incontinent at 3-6 months (data from Hunter et al., 2007¹²³)</p>	<p>Group 1: Baseline: 39 g 1st month: 18 g 2nd month: 7 g 3rd month: 4 g 6th month: 3 g</p> <p>Group 2: Baseline: 31 g 1st month: 11 g 2nd month: 3 g 3rd month: 1 g 6th month: 0 g</p> <p>P value > 0.05</p> <p>Group 1: Baseline: 3.9 1st month: 3.4 2nd month: 1.2 3rd month: 0.8 6th month: 0.4</p> <p>Group 2: Baseline: 3.6 1st month: 1.8 2nd month: 0.9 3rd month: 0.4 6th month: 0.2</p> <p>P value > 0.05</p> <p>Group 1: 4/28 Group 2: 0/14</p>	<p>Funding: NR</p> <p>Limitations: Randomisation and allocation concealment is not described. There is insufficient information about patients' baseline characteristics, no description of sample size calculation. Masking of outcome assessment is not reported.</p> <p>Additional outcomes: No additional outcomes reported</p> <p>Notes: All patients: During the study, patients with irritative symptoms and a negative urine culture received empirical anticholinergic medication (oxybutynin).</p> <p>Continence defined as <1 g loss / 1 hour pad test or < 2 pads per day</p>

Study details	Patients	Methodology	Outcomes	Comments
<p>Paterson et al, 2003²³⁶</p> <p>Study design: Qualitative Study Semi structured interviews and focus groups</p> <p>Evidence level: 3+</p> <p>Duration of follow-up: NR</p>	<p>Patient group: Participants included people who had incontinence or cared for someone with incontinence, or were part of an advocacy group that had significant numbers of people with incontinence in its membership, from metropolitan, rural and remote Australia. Included people of minority backgrounds and indigenous Australians.</p> <p>Purposive and snowballed sampling. Participant recruitment ceased once no new themes emerged.</p> <p>Cause of incontinence: Varied widely and included congenital malformations, chronic debilitating diseases, sever spinal cord injuries and degenerative diseases.</p> <p>All participants N: 82 NR Age (mean): NR M/F: NR Dropouts: NR</p>	<p>Purpose: To understand issues, needs and concerns of people with incontinence to inform development of comprehensive Australian consumer guide to continence products.</p> <p>Analysis method: Key issues transcribed from audio tapes. Constant comparison, thematic data analysis was commenced concurrently with data collection enabling the opportunity to follow up an emerging theme. (grounded theory)</p> <p>Transcriptions and notes taken during sessions Integrated into common themes, shared meanings, similarities and difference.</p> <p>3 researchers conducted analysis, cross- validated with another.</p> <p>Analysis focused on the similarities in experiences and concerns of consumers across the group.</p>	<p>Overall: Striking similarities in experiences and concerns about selection of consumer products.</p> <p>Seeking information:</p> <ul style="list-style-type: none"> - <u>Did not know how to begin to search for information and had problems finding it:</u> Most gathered information themselves, and these are usually not all available in one place. - <u>Feeling vulnerable:</u> Most felt discussing about incontinence management and shopping for products very personal and embarrassing. Some reluctant to speak to professionals. - <u>Lack of confidence in healthcare professional's knowledge:</u> Although dependent on healthcare professionals for assessment and referral, they had not received much helpful advice on products or directed to sources of advice. The most satisfactory help was from specialist continence nurse advisers. Local doctors knew little about assessment and management and many participants were dissatisfied. There was a pervasive "grin and bear with it" attitude and participants were expected to purchase a supermarket product and learn to live with it. - <u>Assessment and management:</u> Participants expressed a need for these to be standardised and coordinated. <p>Finding a suitable product:</p> <ul style="list-style-type: none"> - <u>Tried different products</u> to find one which enable them to remain socially continent. - <u>Advice for product selection:</u> Most had limited product knowledge in early stages and selected from limited range accessible to them in shops, hospital suppliers and recommendations of professionals. However, participants in support networks benefited from exchange of information. - <u>Key factors influencing selection of continence products</u> were quality, comfort and design balanced against availability and cost. Specific product features of concern including noise, allergy, trouble of keeping on, leakage around the seams 	<p>Funding: National Continence Management Strategy, an initiative of the Commonwealth of Australia Department of Health and Aged Care</p> <p>Limitations: Possible selection bias as details of demography, disease, disease severity and role of participants not reported. Not clear whether their target group of 'incontinent' patients is for urinary or faecal incontinence or both.</p> <p>Notes: Analysis did not use verbatim transcripts.</p>

Study details	Patients	Methodology	Outcomes	Comments
			<p>Information about product use and disposal required:</p> <ul style="list-style-type: none"> - Instructions for use and wear - Best methods for care and disposal of products <hr/> <p>Suggestions for content and format of the consumer guide to products:</p> <ul style="list-style-type: none"> - Detailed product description - More information in general about incontinence (causes, treatments and sources of help) and - Use simple layman’s language throughout guide. - Make available a variety of formats and a wide distribution throughout the community 	

1 Evidence Table 8: Catheters vs. no catheters
2

Study details	Patients	Interventions	Outcome measures	Effect size	Comments
<p>Logan et al, 2008¹⁷⁰</p> <p>Study design: Qualitative study</p> <p>Evidence level: 3+</p> <p>Duration of follow-up: NR</p>	<p>Patient group: selected from case lists of a continence and urology service. Patients with experiences of learning clean intermittent self catheterisation (CISC).</p> <p>Patients selected to include maximum variation of characteristics likely to impact on views, attitudes and access to services.</p> <p>Setting: Continence and urology service in Wales.</p> <p>All patients N: 15 M/F: 8/7 Median age (range): 65 (33-81) Duration of use: 6m to >2y Frequency: weekly to four times per day.</p> <p>Reasons for catheterisation: MS, urethral stricture, urine retention.</p>	<p>In depth interviews from January to June 2006 in the UK by two of authors and by a continence nurse. Interview guide developed based on the literature and experience and expertise of the research team. Topics helped guide the interviewer to explore reasons for CISC duration and frequency of CISC, experience of being taught, location, teaching aids, information, ongoing support and follow-up. Guide covered all relevant areas but allowed interviews to pursue themes emerging during the interview.</p>	<p>Psychological-embarrassment and privacy: Views not separated out for men and women.</p> <p>Physical: Technical difficulties were expressed by both sexes. Men’s difficulties were related to negotiating the penile anatomy and handling the lengthy catheters. Generally men had no problem in visualising the urethra. One man experienced muscle spasms and urethral ‘clamping’, causing difficult insertion and frustration in the first few months.</p> <p>The entire sample used coated catheters, commonly describing them as ‘slippery’. To overcome this, some men developed practical handling strategies; another recruited his wife to help. Men with urethral strictures described complications such as discomfort, bleeding and problems negotiating the stricture: ‘Sometimes you (have) got to twiddle, twirl it in around it and just sort of ease it in the best way I can’.</p> <p>Both sexes avoided touching the catheter tip for fear of contamination and infection, illustrating concerns about hygiene and the development of a good technique.</p> <p>In the beginning, respondents found CISC emotionally and technically difficult. Gaining confidence was related to pace of skill acquisition. Men were squeamish at the thought of inserting a catheter for the first time, because of psychological issues and fear of causing internal damage. Q: You were going weak at the knees were you? A: Yes, definitely yes, and the perspiration... I was afraid to blink, I wouldn’t see... you know, from a man’s point of view to think you got something that long to push into yourself!</p> <p>Only two men in study felt confident immediately while the majority took considerably longer to accept CISC as part of their lives.</p> <p>Service interaction: Information-giving: Participants were unfamiliar with CISC, and on</p>	<p>Funding: Gwent Health Care Trust research and development small grant scheme.</p> <p>Limitations: Mix of views from men and women.</p> <p>Additional outcomes: Service interaction was also covered.</p>	

Study details	Patients	Interventions	Outcome measures	Effect size	Comments
					<p>hearing the word catheter feared it would involve a permanent 'catheter and bag': 'I didn't know enough about it – I was just told that I had to start using a catheter and I didn't know any thing at the point...I didn't know that there was a much simpler, straight forward version that you could use yourself and that point I was not at all happy about it' .</p> <p>Practical demonstration was an important component of learning CISC, and a few participants felt that their demonstrations had been insufficient: 'I would have liked more than one demonstration or more time spent...I was only shown once and I had to get on with it then.'</p>

<p>Shaw et al, 2008²⁷³</p> <p>Same trial as Logan, et al (see evidence table above) reporting more outcomes on QOL</p> <p>Study design: Qualitative study</p> <p>Evidence level: 3+</p> <p>Duration of follow-up: NR</p>	<p>Patient group: selected from case lists of a continence and urology service. Patients with experiences of learning clean intermittent self catheterisation (CISC).</p> <p>Patients selected to include maximum variation of characteristics likely to impact on views, attitudes and access to services.</p> <p>Setting: Continence and urology service in Wales.</p> <p>All patients N: 15 M/F: 8/7 Median age (range): 65 (33-81) Duration of use: 6m to >2y Frequency: weekly to four times per day.</p> <p>Reasons for catheterisation: MS, urethral stricture, urine retention.</p>	<p>In depth interviews from January to June 2006 in the UK by two of authors and by a continence nurse. Interview guide developed based on the literature and experience and expertise of the research team. Topics helped guide the interviewer to explore reasons for CISC duration and frequency of CISC, experience of being taught, location, teaching aids, information, ongoing support and follow-up. Guide covered all relevant areas but allowed interviews to pursue themes emerging during the interview.</p>	<p>Impact on QoL:</p> <p>Positive impacts <u>Specific comments from men:</u> There were reports of relief from symptoms such as recurrent urinary tract infections. “I would rather do this than put up with the symptoms of infection.”</p> <p>CISC was also deemed to be a preferable option compared to other management strategies, such as permanent catheters with leg bags. “I said, ‘I don’t want a catheter fixed to me permanent, this bag on the leg or whatever they use’”.</p> <p>Negative impacts <u>Specific comments from men:</u> “..if I found a disabled toilet where you can go into the room and wash your hands and whatever, and in a normal toilet you can’t do that”</p> <p>“I have a problem when I am out...Finding water... If you go to a public toilet you have to fill it and then go into the toilet.”</p> <p>Difficulty experienced in travelling Carrying the necessary equipment was a particular problem:</p> <p>“Yes. I can’t travel light. Where I would much prefer to get on the train and go over and come back again, I now drive”</p> <p>Physical impacts <u>Specific comments from men:</u> Some reported occasional bleeding, or ongoing discomfort: “Oh it still gets sore now...especially with the withdrawal, insertion and withdrawal. And, of course, when you empty your bladder for the first time after the procedure, it’s grit your teeth..”</p> <p>Carrying out CISC</p>		<p>Funding: Gwent Health Care Trust research and development small grant scheme.</p> <p>Limitations: Mix of views from men and women.</p> <p>Additional outcomes: Same trial as Logan, et al (see evidence table above) reporting more outcomes on QOL</p>

Study details	Patients	Interventions	Outcome measures	Effect size	Comments
					<p><u>Specific comments from men:</u> One man had a common problem of muscle spasm preventing insertion of the catheter. Whilst he had learned how to manage this, he found it an inconvenience as he had to wait before trying to catheterize again.</p> <p>Factors explaining variation in QoL impacts Reasons for carrying out CISC and sex issues: More men found CISC to be a nuisance and time-consuming. This was related to the reasons carrying out CISC. More women carried it out to relieve previously severe urinary tract symptoms, whereas men tended to have problems with urethral stricture or voiding difficulties in the absence of severe symptoms. Because of differences in physiology and the longer urethra, men were more likely to be anxious about the catheter causing discomfort or pain, or about inadvertent damage because of poor technique.</p> <p>Type of catheter and sex issues There were sex differences related to type of catheter as male catheters are longer and more unwieldy. This had implications for carrying catheters discreetly. Women easily carried catheters in their handbags, whereas men were less likely to carry a bag and had difficulty carrying catheters in their pockets.</p>

Kirby et al., ¹⁴⁷ Study design: RCT double blinded(4 arms) Setting: 90 European centres Evidence level: 1+ Duration of follow-up: 1 year(52 weeks)	Patient group: Symptomatic BPH Inclusion criteria: <ul style="list-style-type: none"> ▪ Aged 50 to 80 years ▪ IPSS≥ 12 ▪ Qmax of ≥5 mL/s but ≤15 mL/s in a total voided volume of ≥150 mL ▪ Enlarged prostate as determined by DRE. Exclusion criteria: <ul style="list-style-type: none"> ▪ Previous prostate surgery or other invasive procedures for treating BPH ▪ Prostate cancer or a PSA level exceeding 10 ng/mL. If PSA was between 4.1 to 10 ng/mL, need to have ≥2 of the following : negative DRE or transrectal ultrasound findings(within the past 3 months) or negative biopsy findings(within the past 4 weeks) ▪ lower urinary tract symptoms or reduced urinary flow rates resulting from a condition other than BPH ▪ large bladder diverticulum, bladder stones, recurrent urinary tract infection, or two or more episodes of AUR requiring catheterization within the year 	Group 1: Doxazosin 4 mg(+ placebo) Initiated on 1 mg/day, titrated to 2 mg at end of week 2 and, 4 mg from end of week 6. At the end of week 10, the 4-mg dose was maintained in subjects who met the following two criteria: (a) total IPSS had decreased by 30% or more from baseline, and(b) Qmax had increased by 3 mL/s or more from baseline. For subjects who did not meet these goals, the doxazosin dose was increased to 8 mg/day and maintained for the remaining 42 weeks. Doses were reduced to the next lower dose if the SBP/diastolic BP(DBP) fell to less than 90/60 mm Hg or tolerability was limited. Subjects unable to tolerate a 2-mg/day dose of	IPSS, mean ±SD at 1 year	Group 1: 8.7 ± 5.8 Group 2: 10.9 ± 6.2 Group 3: 8.7 ± 6.2 Group 4: 11.8 ± 6.9	Funding: Grant provided by Pfizer Ltd. Finasteride & placebo provided by Merck & Co Limitations: Randomisation allocation and concealment methods not stated. Additional outcomes: Mean change in sitting and SBP and DBP: Normotensive subjects: Not sig Hypertensive subjects (sitting DBP≥90mmHg, SBP≥140mmHg): LS mean change (sitting SBP/DBP, mmHg) for doxazosin: -11.8/-5.7 Doxazosin + finasteride: -9.2/-5.6 (P<0.05, clinically sig)

McVary et al., 2007 ^{c196} Study design: Randomised controlled trial. Setting: USA Evidence level: 1+ Duration of follow-up: 12 weeks	Patient group: men with erectile dysfunction and LUTS/BPH from 41 urology clinics and clinical research centres. Inclusion criteria: Men ≥45 years, had a clinical diagnosis of ED (score ≤25 on the erectile function domain of the International Index of Erectile Function) and IPSS ≥12. Exclusion criteria: Men with confirmed or suspected prostate malignancy, serum prostate-specific antigen >10ng/ml, previous invasive intervention for BPH, or previous prostate or bladder/pelvic rations or surgery. Those with PSA between 4-10ng/ml required two additional forms of documentation to confirm the absence of clinically evident malignancy. Men with acute urinary tract disease or cystoscopy with in 4 weeks of the trial, calculi in the urinary tract or acute urinary retention within 6 months of the trial, recurrent urinary tract infections or catheterisation for outflow obstruction in the year before the trial, or other known or suspected causes of urinary symptoms other than BPH, hypotension, hypertension orthostatic hypotension or significant cardiovascular disease. Men were excluded if used	Group 1: Phosphodiesterase 5 inhibitors Sildenafil citrate: 50mg once daily with each night at bedtime or 30 minutes to 1hr before sexual activity. After 2 weeks the does increased to 100mg but could be decreased to 50mg if the higher dose was not tolerated. Group 2: Placebo	Mean (SD) IIEF – erectile function domain (1-30; higher scores indicate better treatment outcome) Least mean change in IPSS score Least mean change in Qmax, ml Least mean change in IPSS quality of life score LS mean (SE) EDITS score (end of treatment satisfaction score; 0-100) Number (%) of patients reporting adverse events Number (%) of treatment related adverse events Headache Flushing Dyspepsia	Baseline Group 1: 13.4 Group 2: 13.2 Change from baseline Group 1: 9.2 (1.0) Group 2: 1.9 (1.0) Mean change: 9.17, 95% CI: 7.25-11.09 vs. 1.86, 95% CI: -0.03, 3.74; p<0.0001 Group 1 (n=182): -6.3 (-8.1, -4.6) Group 2 (n=178): -1.9 (-3.7, -0.2) P<0.001 Group 1: 0.31 (-1.6, 2.2) Group 2: 0.16 (-1.7, 2.1) P=0.8 Group 1: -0.97 (-1.32, -0.62) Group 2: -0.29 (-0.64, 0.05) P<0.001 Group 1: 71.2±3.2 Group 2: 41.7±3.2; p<0.0001 Group 1: 100/189 (53%) Group 2: 78/180 (43%) Group 1: 86/189 (%) Group 2: 25/180 (%) Group 1: 21/189 (11%) Group 2: 6/180 (3%) Group 1: 9/189 (5%) Group 2: 1/180 (1%) Group 1: 12/189 (6%) Group 2: 2/180 (1%)	Funding: Supported by Pfizer, Inc. Limitations: Actual figures and SD not provided for IPSS, Qmax and IPSS QoL question. Additional outcomes: BPHII score, SEAR questionnaire (self-esteem and relationship questionnaire) Notes: 8 week open label extension study after this 12 week study. Least square means calculations used for analysis. NCGC calculated SD for meta-analysis from Cochrane calculations.

Mavuduru RM 2009 ¹⁸⁷ Study design: RCT Evidence level: 1+ Setting: Chandigarh, India Duration of follow-up: 9 months	Patient group: Patients who underwent surgery for BPH. Inclusion criteria: Exclusion criteria: Patients with a history of previous prostatic or urethral surgery, and documented cases of prostate carcinoma. All patients N: 30 Group 1: TURP N: 15 Age (mean): 66.46±5.79 Drop outs: 0 Group 2: HoLEP N: 15 Age (mean): 69.86±9.6 Drop outs: 0	Group 1: Transurethral resection of the prostate (TURP). TURP was performed by standard technique using a 26-Fr continuous flow resectoscope (Karl Storz) with a cutting current of 100-120 D and coagulating current of 50-60 W. The intraoperative irrigation fluid used was 1.5% glycine, the TURP chips were removed by Ellick's evacuator. Group 2: Holmium laser enucleation of the prostate (HoLEP) Instrumentation included 550nm end-firing flexible quartz, and a continuous flow resectoscope consisting of a 27-Fr outer sheath, an inner rotating sheath with a self-designed working element. HoLEP was performed by standard technique as described by Gillig et al. The machine used was Versapulse Holmium Laser, with a frequency of 35-40 Hz and a power setting of 2 joules. The irrigant used	Mean ±SD symptom score- IPSS	Baseline: Group 1: 21.4±3.7 Group 2: 22.53±4.79 3 months: Group 1: 2.86±1.72 Group 2: 2.26±1.57 p value: 0.329 9 months: Group 1: 3.57±1.03 Group 2: 4.32±1.25 p value: 0.37	Funding: NR Limitations: Small study size and duration of follow up is less than 1 year. Median prostate volume, ml = 43 Drop outs: 2 (one had TURP, other had apoplexy at 4m and only had 3m follow-up)</p> <p>Group 3 N: 24 Mean age (SD): 68 (7) Median prostate volume, ml = 44 Drop outs: 2 (prostate cancer)</p>		<p>Urinary retention:</p> <p>Urinary tract infection:</p> <p>Transurethral resection syndrome (TUR)</p> <p>Transfusion:</p> <p>Stricture:</p> <p>Urinary incontinence:</p> <p>Development of erectile dysfunction:*</p> <p>Development of retrograde ejaculation:</p> <p>Reoperation for BPO</p> <p>Mortality</p>	<p>Group 1: 4/44 (9%) Group 2: 3/46 (7%) Group 3: 1/22 (5%)</p> <p>Group 1: 27/44 (61%) Group 2: 14/46 (30%) Group 3: 3/22 (14%)</p> <p>Group 1: 0/44 (0%) Group 2: 0/46 (0%) Group 3: 1/22 (5%)</p> <p>Group 1: 0/44 (0%) Group 2: 0/46 (0%) Group 3: 2/22 (9%)</p> <p>Group 1: 1/44 (2%) Group 2: 0/46 (0%) Group 3: 1/22 (5%)</p> <p>Group 1: 0/44 (0%) Group 2: 0/46 (0%) Group 3: 1/22 (5%)</p> <p>Group 1: 4/18 (29%) Group 2: 2/22 (9%) Group 3: 1/7 (14%)</p> <p>Group 1: 9/26 (35%) Group 2: 6/27 (22%) Group 3: 7/14 (50%)</p> <p>Group 1: 0/44 (0%) Group 2: 1/46 (2%) Group 3: 0/22 (0%)</p> <p>Group 1: 0/44 (0%) Group 2: 0/46 (0%) Group 3: 0/22 (0%)</p>	<p>* Erectile dysfunction and retrograde ejaculation was only estimated amongst those who had answered the relevant questions both at baseline and at the 6 month follow-up. Each question was scored from 0 to 3. For evaluation of ejaculation, patients scoring 0, 1 and 2 (i.e. normal amount, slightly reduced and greatly reduced amount of semen) were classified as having antegrade ejaculation. Patients scoring 3 (i.e. no ejaculation) were classified as having retrograde ejaculation.</p>

Brehmer et al., 1999 ³⁴ Study design: RCT Setting: Sweden Evidence level: 1+ Duration of follow-up: 12 months	Patient group: Men with LUTS dominated by hesitancy, slow urination and an enlarged prostate. Inclusion criteria: maximum flow rate of <12mL/s Exclusion criteria: indwelling catheter, median prostatic lobe, a prostate gland estimated as >50g, suspected prostatic malignancy, neurological disease and previous surgery for prostatic disease. All patients N: 44 Mean age (range): 70.4 (53-83) Drop outs: 2 Group 1 N: 14 Dropouts: 1 (withdrew as had repeated transient ischaemic attacks and developed early dementia) Group 2 N: 16 Dropouts: 0 Group 3 N: 14	An ECP system (Comair, Sweden) equipped with a 22F catheter with a microwave antenna (915MHz), a fibre-optic system for measuring the temperature in the urethra and, by a rectal probe in the rectum. The two-way urethral catheter has a circulation cooling system that reduces the heat delivered to the urethral wall. Maximum heating is achieved within 30s and the temperature limit is 46 degrees in the urethral and 43 in the rectum. If unable to void a urethral catheter inserted and left in place for 3 days. All patients received antibiotics for 5 days. Group 1: TUMT for 30 minutes Group 2: TUMT for 60 minutes Group 3: SHAM Only water at 20° was circulated in the treatment catheter and a computer monitor, visible to the patient, showed a simulated heat treatment curve, similar to that	Qmax, mL/s	Baseline: Group 1: 8.7 Group 2: 7.0 Group 3: 7.9 4 months: Group 1: 12.3 Group 2: 9.9 Group 3: 8.3	Funding: NR Limitations: Method of randomisation, allocation concealment unclear. Baseline urodynamic scores similar between groups but A scores were significantly higher in the 30 minute TUMT group (Group 1). Complications reported as whole rather than by group. Additional outcomes: Frequency and timed void before and after treatment. % improved in different variables reported (but actual figures reported in full). Notes: ICS score defined as a Questionnaire with 32 questions (A questions about symptoms and B question about the bother related to the symptom. Maximum A and B scores are 124 and 92 respectively. High score
			Treatment failure	Group 1 & 2: 5/30 (17%) Group 3: 7/14	
			Reoperation	Group 1: 0/14 Group 2: 3/16 Group 3: 7/14	
			ICS A score (with % decrease) * See notes for definition of score	Before Group 1: 58 Group 2: 49 Group 3: 46 4 months: Group 1: 44 (25) Group 2: 41 (16) Group 3: 44 (4)

Study details	Patients	Interventions	Outcome measures	Effect size	Comments	
Zerbib et al, 1994 ³³¹ Study design: Randomised controlled study Setting: France Evidence level: 1+ Duration of follow-up: 3 months	Patient group: symptomatic BPH patients. Inclusion criteria: candidates for prostatectomy. All had failed one conservative treatment (e.g. alpha-blockers) and the symptoms were of sufficient severity such that prostatectomy was indicated. Exclusion criteria: anterior rectal wall thickness >10mm or <2mm; anterior to posterior thickness of prostate >55mm. All patients N: 68 Mean age: 69.5±10.44 (53-88) Drop outs: NR Group 1 N: 38 Group 2 N: 30	Group 1: TUMT Prostatic hyperthermia treatments were performed using Prostathermer. Intraprostatic temperature maintained at 43±0.5°C. 1 hour session per week for 5 consecutive weeks. Outpatient without anaesthesia. Group 2: SHAM Intraprostatic temperature maintained at 37±0.5°C by radiofrequency power. One hour session per week for 5 consecutive weeks.	Mean (SD) peak flow, ml/s Baseline Group 1: 7.6 (3.8) Group 2: 10.6 (5.8) 3 Months: Group 1: 9.60 (5.80) Group 2: 10.8 (5.4)	Baseline Group 1: 7.6 (3.8) Group 2: 10.6 (5.8) 3 Months: Group 1: 9.60 (5.80) Group 2: 10.8 (5.4)	Funding: NR. Limitations: Randomisation method and allocation concealment unclear. Baseline peak flow significantly different between arms. Inclusion and exclusion criteria not defined. No complications reported. Additional outcomes: Siroky S.D. and adjusted flow scores. Response rate (objective criteria) reported. Notes: 3 month result for peak flow for TUMT group not reported in study – result obtained from HTA report.	
			Mean (SD) voided volume, ml Baseline Group 1: 151 (92.0) Group 2: 145 (86.3) 3 Months: Group 1: 154 (90) Group 2: 166 (91.3)			Baseline Group 1: 151 (92.0) Group 2: 145 (86.3) 3 Months: Group 1: 154 (90) Group 2: 166 (91.3)
			Mean (SD) Residual volume, ml Baseline Group 1: 110 (88.8) Group 2: 84.2 (76.6) 3 Months: Group 1: 67 (101.6) Group 2: 81.2 (66.8)			Baseline Group 1: 110 (88.8) Group 2: 84.2 (76.6) 3 Months: Group 1: 67 (101.6) Group 2: 81.2 (66.8)

Hindley2001 ¹¹⁸ Study design: RCT Setting: UK Evidence level: 1+ Duration of follow-up: 2-year Links with MOSTAFID1997 ²⁰⁵	Inclusion criteria: <ul style="list-style-type: none"> Men > 50 years referred to an integrated prostate-assessment unit for cystometry. Urodynamically confirmed bladder outlet obstruction (BOO) due to BPH, defined as Pdet Q_{max} value within the obstructed area of the Abrams Griffith pressure/flow nomogram. Bothersome LUTS, defined as an IPSS>=13 and an IPSS QOLscore ≥3 Written informed consent. Exclusion criteria: <ul style="list-style-type: none"> History of any illness or surgery that might confound the results of the study, and that produce symptoms which might be confused with those produced by BPH, or that pose additional risk to the patient. Confirmed or suspected malignancy of the prostate by DRE or biopsy. PSA level >4 ng/mL unless T1 carcinoma of the prostate excluded by TRUS-guided biopsy. Previous prostatic surgery or thermotherapy Pharmacological treatment of symptomatic BPH within the last 6 months. Confirmed or suspected bladder cancer. Previous rectal surgery other than haemorrhoidectomy. Previous pelvic irradiation. History of cystolithiasis, haematuria or bladder pathology, urethral strictures, bladder neck contracture, active urinary tract infection or prostatitis. 	Group 1: TUNA A simple disposable 7 F RF needle-electrode was inserted into the lateral lobes of the prostate and, where appropriate, the median lobe of the prostate, using a catheterising endoscope. A standard surgical diathermy generator was used to produce the 10 W of coagulation for 3 min. After treatment, patients were catheterised and allowed home on first-operative day. The catheter was removed and a trial of voiding carried out 7 days after treatment. Group 2: TURP Patients undergoing TURP were operated on by an experienced surgeon according	Mortality There were no deaths during the 2-year follow-up.	Funding: NR	
			IPSS, median (interquartile range)	Effect size Baseline Group 1: 20 (15-23) (n=25) Group 2: 22 (18-15) (n=25) 6-months: Group 1: 9 (6-23) (n=20) Group 2: 3 (2-6) (n=22) 1 year: Group 1: 6 (4-10) (n=19) Group 2: 3 (2-6) (n=19) 2 years: Group 1: 8 (5-13) (n=19) Group 2: 3 (1-5) (n=19) P value: NR for all time points	Limitations: <ul style="list-style-type: none"> Small sample size Drop outs accounted for but intention to treat analyses not conducted. Donovan et al., 2000 ⁷⁴	Patient group: men with uncomplicated LUTS symptoms	Group 1- Laser coagulation Procedure: Nd:YAG/ Non-contact VLAP, side-firing fibre (Bard Urolase), using standard fixed spot technique Power: 60W ND: YAG for 60s, depends on prostate size. For prostate size with urethral length of >25 mm, additional set of laser was used. If median lobe was present, 60W for 30s was applied for each side of lobe. Energy: 28684J Catheter protocol: Suprapubic catheter, removed when clinically appropriate. Other: All patients received antibiotic prophylaxis and anti-inflammatory suppository.	IPSS, mean change from baseline (95%CI): Adjusted for centre and baseline symptom score, ANCOVA	Group 1: -10.8 ± 8.64* (95% CI: -12.5,-9.0), n=96 Group 2: -12.3 ± 7.36* (95% CI: -13.8,-10.7), n=89 Group 3: -1.3 ± 5.29* (95% CI: -2.8,0.2), n=85 p value: Group 2 v Group 3 - NR	Funding: Laser machines provided by Bard Diagnostics, Redmond, Washington. Limitations: • Open label study, with main outcomes using patient reported measures • The clinician following up patients was different to the surgeon although it was not stated whether the clinician was masked to treatment allocation
CLasP study	Setting: 3 centres in UK		IPSS-QoL, mean (95%CI): Adjusted for centre and baseline symptom score, ANCOVA	Group 1: -1.9 ± 1.7* (95% CI: -2.3, -1.6), n=93 Group 2: -2.2 ± 1.62* (95% CI: -2.5, -1.8), n=85 Group 3: -0.4 ± 1.39* (95% CI: -0.7, -0.1), n=85 p value: Group 2 v Group 3 - NR	
Study design: RCT, multicentre, open label	Inclusion criteria: • IPSS score of ≥8, with physician and patient agreement that the symptoms require intervention • Qmax <15ml/s when voided volume >200ml, <13ml/s when voided volume between 150-200ml and <10ml/s when voided volume between 100 to 149ml measured on two occasions, with the higher value between these two used for analysis • >300ml post void volume urine on ultrasound		Qmax, mean(95%CI): Adjusted for centre and baseline symptom score, ANCOVA	Group 1: 5.8 ± 6.87* (95% CI: 4.5, 7.2), n=102 Group 2: 9.7 ± 9.73* (95% CI: 7.7, 11.6), n=98 Group 3: 0.2 ± 2.9* (95% CI: -0.4, 0.8), n=92 p value: Group 2 v Group 3 - NR	Additional outcomes: Composite outcomes categories, and categorical outcomes for IPSS and Qmax
Evidence level: 1+	Exclusion criteria: • Prostate cancer or previous prostatic surgery; • prostate size > 120ml; • Life expectancy < 6 months; • Urinary retention associated with recent operation, constipation or drugs which could cause acute urinary	Group 2 –TURP Procedure: Standard electroresection	Post void residual volume, mean(95%CI): Adjusted for centre and baseline symptom score, ANCOVA	Group 1: -73.4(95% CI:-91.3, -55.5), n=100 Group 2: -74.0 (95% CI:-89.2, -58.8), n=98 Group 3: 2.19 (95% CI:-23.1, -27.5), n=90 p value: Group 2 v Group 3 - NR	Notes: Randomisation using computer generated numbers in blocks of 6
Duration of follow-up: 7.5 months

Study details	Patients	Interventions	Outcome measures	Effect size	Comments
McNeill et al., 1999 ¹⁹³	Patient group: patients with a first episode of acute urinary retention related to benign prostatic obstruction were recruited between September 1996 and March 1998 from 4 centres in Scotland.	Group 1: alpha-blocker Sustained-release alfuzosin, an alpha1-selective blocker, (5mg twice daily, with no dose titration) for 48 hours. Catheter removed after 24 hour of treatment and final dose was given on the afternoon after catheter removal.	Number (%) of patients successful: (defined as able to void successfully after removal of catheter and not re-catheterised within 24h)	Group 1: 22/40 (55%) Group 2: 12/41 (29%), P=0.034 Odds Ratio (OR): 2.95 (95% CI 1.08-8.21)	Funding: Financial support for the study was received from Lorex Synthelabo UK & Ireland; authors received financial support from Lorex Synthelabo to attend and present their work at scientific meetings.
Study design: Randomised controlled trial	Inclusion criteria: 55 years or over; residual volume of 0.5-1.5L on catheterisation.	Group 2: placebo Identical procedure as intervention but with placebo (twice daily for 48 hours).	Number (%) of patient successful using per-protocol analysis (excluding patient that withdrew and failed to complete medication)	Group 1: 22/39 (56%) Group 2: 12/41 (29%), P=0.026 Odds Ratio (OR): 3.13 (95% CI 1.13-8.76)	Limitations: The mean age was 5 years lower in the intervention group (significant difference).
Setting: Scotland (4 centres)	Exclusion criteria: patients unwilling or unable to give informed consent; significant renal and/or hepatic disease; depressive illness on medication; extra-pyramidal disorders; neurological disease; confirmed or suspected urethral stricture; dipstick detected UTI, acute or chronic prostatitis. History of unstable angina pectoris, myocardial infarction, transient ischaemic attacks, cerebrovascular accident of congestive cardiac failure during the previous 6 months, current or previous orthostatic hypotension. Patient taking monoamine oxidase inhibitors, cholinergic or anticholinergic drugs, calcium-channel blockers, or alpha blocking drugs. Other antihypertensive drugs were not altered whilst the patient was receiving the trial medication. Phytotherapy or finasteride use did not exclude patients from study but		Mean (SD) age for all patients:	Successful: 68.4 (7.8) Unsuccessful: 72.9 (8.1) P=0.02	
Evidence level: 1+			Mean (SD) age by success in each group:	Group 1: Successful: 69.1 (8.7) Unsuccessful: 69.6 (7.3), p=0.81 Group 2: Successful: 67.2 (6.1) Unsuccessful: 75.0 (8.1), p=0.005	Following power calculation the authors planned to recruit 100 per arm to detect a 20% difference in outcome with 95% power. Unable to reach this number before the trial medication expired. The difference in outcome between the groups was >20% and power of the study is reflected in statistical significance of the results.
Duration of follow-up: Treatment for 48 hours. Follow-up of successful patients for mean 7.2 months			Logistic regression analysis of treatment versus outcome adjusted for age	P=0.052 OR: 2.55, 95% CI 0.99-6.58	
			Logistic regression using per-protocol analysis:	P=0.039 OR: 2.72, 95% CI 1.05-7.08	
			All reported adverse events	Faint: Group 1: 1/40 Group 2: 0/41 Dizziness: Group 1: 1/40 Group 2: 0/41	Additional outcomes: Comparison of variables

Study details	Patients	Interventions	Outcome measures	Effect size	Comments
	<p>their use was recorded. Known hypersensitivity to afluzosin or alpha blockers. Patients requiring suprapubic catheterisation where urethral catheterisation was unsuccessful; patients who had a suprapubic catheter as a primary procedure were not excluded. Postoperative retention after major abdominal/pelvic surgery. Large residual volume, clot retention secondary to haematuria of any cause.</p> <p>All patients N: 81</p> <p>Group 1 N: 40 Mean (\pmSD) Age: 67.7 (13.6) Dropouts: 1 (withdrew following a faint after the first dose of the trial medication)</p> <p>Group 2 N: 41 Mean (\pmSD) Age: 72.7 (8.33) Dropouts: 0</p>			<p>Headache: Group 2: 1/40 Group 2: 0/41</p> <p>Atrial fibrillation* Group 1: 1/40 Group 2: 0/41</p>	<p>between successful and unsuccessful patients. Non significant results for mean residual volume on catheterisation, mean duration of catheterisation and prostate size.</p> <p>Additional follow-up of 11/34 (32%) successful patients experiencing a further episode of AUR and/or requiring a prostatectomy (mean follow-up of 7.2 months).</p> <p>Notes: Atrial fibrillation 8 hours after last dose, which was later resolved. A subsequent 24-h ECG revealed previously undiagnosed asymptomatic paroxysmal atrial tachycardia, which was treated with sotalol.</p>

Engelmann U et al., 2006 ⁸² Study design: RCT Setting: 23 private urological practices in Germany. Evidence level: 1+ Duration of follow-up: 60 weeks	Patient group: Outpatients suffering from BPH that did not require surgery. Inclusion criteria: A maximum urinary flow rate ≤ 12 ml/s at a urinary volume ≥ 150 ml was required. Aged 50 years old and above. Initial IPSS score of ≥ 13 points and an IPSS QoL assessment score ≥ 3 . Exclusion criteria: Patients whose peak urinary flow rate changed by more than 3 ml/s during a 2-week placebo run-in phase were excluded. Patients with a residual urinary volume > 150 ml, congested urinary tract passages, an indication for BPH surgery, urinary tract infection, prostate carcinoma, diabetes, neurogenic or bladder dysfunction as well as patients previously treated with 5 α -reductase inhibitors. All patients N: 140 Drop outs: 9/140 Group 1 N: 71 Age \pm SD, years: 65 ± 8 Time since diagnosis of BPH (years): 3.1 ± 4 Dropouts: 11 Group 2 N: 69 Age \pm SD, years: 65 ± 8 Time since diagnosis of BPH (years): 3.61 ± 4.5 Dropouts: 8	Group 1: PRO 160/120 160mg Sabal fruit extract and 120mg Urtica root per capsule. Group 2: Tamsulosin Slow-release capsules containing 0.4mg active ingredient. For both drugs placebo capsules were available which were indistinguishable from their pharmacologically active counterparts in all aspects of their outer appearance. (After screening patients entered a single blind placebo run in phase of two weeks.) Examination methods: Visits scheduled after 8, 16, 24,	Median IPSS total score	Baseline Group 1: 20 Group 2: 20 24 weeks Group 1: 13 Group 2: 12 60 weeks Group 1: 10 Group 2: 9	Funding: NR Limitations: Median scores reported. Details of adverse events not reported. Additional outcomes: Subgroup analysis of patients with IPSS baseline score of ≤ 19 and IPSS baseline score ≥ 20 Erectile function score – median score change for both groups = 0. Notes: Randomization was performed in balanced blocks, by means of a validated EDP random number generator program.
			Median improvement from baseline in LUTS-associated QoL (single item, range 0 [very good] -6 [very bad]).	Group 1: 2 Group 2: 1	
			Adverse events (details not reported)	Group 1: 15 patients (21.1%) reported 18 events Group 2: 19 patients (27.5%) reported 23 events.

Study details	Patients	Interventions	Outcome measures	Effect size	Comments
Murray2001 ²⁰⁷ UK	Patient group: Men with benign prostatic hypertrophy in 33 general practices in the UK.	Group 1: Interactive multimedia programme with booklet and printed summary. Treatment options discussed were surgery, balloon dilatation of the prostate, drugs, and watchful waiting. Information comprised probabilities of the risks and benefits of each treatment, calculated on the basis of information on age, severity of symptoms, and general health entered by the patient at the beginning of the session. All patients saw the core interactive video disc, lasting about 45 minutes; viewing optional sections for further information took up to 60 min. more. A research nurse started the programme, taught the patient how to use it, and then withdrew.	Mean (SD) decisional conflict score at nine months	Group 1: 2.23 (0.38) Group 2: 2.55 (0.50) p value: sig	Funding: NHS national research and development programme, the BUPA Foundation, and the King's Fund. Limitations: Results on EQ-5D scores were not reported. The intervention might be different to the clinical practice with a consequent overestimation of costs. Additional outcomes: No difference in health utility scores (EQ-5D) and anxiety scores (data not provided). Mean decisional conflict score at 3 months (-0.3). GPs and patients' perception of decision making at 3months was significantly different between the two groups with higher proportion of GPs and patients perceiving that the treatment decision had been mainly or only by the patients in Group 1. Notes: *Only 48 included in the economic analysis
Economic analysis: cost consequences analysis	All patients N: 112 Drop outs: 10		Median change in American Urological Association scores	Group 1: -1 Group 2: -2 p value: 0.8

Figure E-47: PDE5-I vs. Alpha-blockers: Nocturia

—

Figure E-48: PDE5-I vs. Alpha-blockers: Adverse events**3.5 Diuretics****3.5.1 Diuretics vs. placebo**

Forest plots were not prepared for this comparison. Please see Evidence Table 16 in Appendix D for details.

3.6 Desmopressin**3.6.1 Desmopressin vs. placebo**

Forest plots were not prepared for the efficacy outcomes of this cross over trial. Please see Evidence Table 17 in Appendix D for details.

Figure E-49: Desmopressin vs. Placebo: Adverse events

This is a cross over trial and a paired test would be more appropriate. Forest plots prepared for illustration purpose.

3.7 NSAIDS

3.7.1 NSAIDS vs. placebo

Figure E-50: NSAIDs vs. Placebo: Symptom score at 1 month

—

Figure E-51: NSAIDs vs. Placebo: Qmax (ml/s) at 1 month

—

Figure E-52: NSAIDs vs. Placebo: Nocturia frequency at 1 month

—

Figure E-53: NSAIDs vs. Placebo: Adverse events (1 month follow up)

—

Only one type of adverse event was reported.

3.8 Combination therapy: Alpha-blockers plus 5-alpha reductase inhibitors(5-ARI)

3.8.1 Combination (Alpha-blockers + 5-ARI) vs. Alpha-blockers

Figure E-54: Combination (Alpha-blockers + 5-ARI) vs. Alpha-blockers: Symptom score

Figure E-55: Combination (Alpha-blockers + 5-ARI) vs. Alpha-blockers: Qmax (ml/s)

Figure E-56: Combination (Alpha-blockers + 5-ARI) vs. Alpha-blockers: Prostate volume(ml)

Figure E-57: Combination (Alpha-blockers + 5-ARI) vs. Alpha-blockers: PSA (ng/ml)

Figure E-58: Combination (Alpha-blockers + 5-ARI) vs. Alpha-blockers: Adverse events (cardiovascular or neurological)

The studies were arranged in the forest plots based on duration of follow up (6 months for Debruyne1998, 1 year for Lepor1996 and Kirby2003, 2 years for Roehrborn2008 and 4 years for McConnell2003)

Appendix F - Cost-effectiveness analysis

2

10.1 Introduction

Two original cost-effectiveness analyses were carried out to answer the clinical questions on transurethral resection of the prostate (TURP) vs. laser (Chapter 8), and the clinical question on Alpha-blockers (AB) alone or in combination with 5-Alpha Reductase-Inhibitors (5-ARI) (Chapter 6). Throughout the guideline we refer to these two analyses respectively as 'NCGC Surgery Model' and 'NCGC Combination model'.

10.2 Methods

A review of the literature was conducted followed by economic modelling of the cost-effectiveness of the listed interventions in England and Wales. The literature search and review methods can be found in Chapter 2.

Our aim in constructing the models was to determine the most cost-effective strategy in men considering respectively surgery and medical treatment. Those would be mainly men with moderate to severe lower urinary tract symptoms (LUTS).

We found a number of economic evaluations in the published literature (Chapters 6 and 8), among which a Health Technology Assessment (HTA) model of good quality¹⁷². However the Guideline Development Group (GDG) felt that they needed an original model with slightly different assumptions and data in order to make a recommendation with confidence.

The following general principles were adhered to:

- The GDG was consulted during the construction and interpretation of the model.
- When published data was not available we used expert opinion to populate the model.
- Model assumptions were reported fully and transparently.
- The results were subject to sensitivity analysis and limitations were discussed.
- We followed the methods of the NICE reference case²¹⁵. Therefore costs were calculated from a health services perspective. Health gain was measured in terms of quality-adjusted life-years (QALYs) gained. Both future costs and QALYs were discounted at 3.5%.
- The model employed a cost-effectiveness threshold of £20,000 per QALY gained.
- The model was peer-reviewed by another health economist at the NCGC.

1 **10.2.1 Software**

2 The cost-effectiveness analyses were conducted using TreeAge Pro 2008.

3

4 **10.3 NCGC Surgery model**

5 **10.3.1 General method**

6 We based the model on two of the main outcomes considered in our systematic
7 review of the clinical evidence (Chapter 2.4): mean IPSS change from baseline
8 and adverse events. We chose IPSS change because it better expresses the
9 change in quality of life as felt by the patient compared to other clinical
10 measures such as Qmax. Consequently, it was easier to find data linking utility
11 values to levels of symptoms.

12 Since LUTS are a lifelong condition, we built a Markov model with a life time
13 horizon and we changed this in a sensitivity analysis. The cycle length is three
14 months, as this was deemed the minimum clinically meaningful time interval to
15 detect differences in patients undergoing surgery.

16 All the probabilities, costs and health utilities were converted in order to reflect
17 the three-month values.

18 The treatments compared in our analysis are TURP and Holmium Laser
19 Enucleation of Prostate (HoLEP). TURP is the current standard practice and HoLEP
20 was one of the alternative treatments that were significantly effective as
21 compared to TURP. Transurethral electrovaporisation of prostate (TUVP) was
22 another effective treatment as compared to TURP but the available economic
23 evidence was considered sufficient to prove it cost-effective.

24 Patients in the studies included in our clinical review had a moderate-to-severe
25 level of symptoms. Therefore patients in our model were defined as men with
26 moderate-to-severe LUTS who are suitable for either TURP or HoLEP.

27 Both arms of the model have the same structure (Figure 236): after the
28 intervention, the patient can either have a significant remission of symptoms
29 (success) or no remission/minor remission (failure).

30 Short-term complications identified in the clinical review (see Appendix E) were
31 assumed to be resolved within 3 months (the cycle length) and could occur with a
32 probability independent from the success. Incontinence is the only long-term
33 adverse event and in some cases it requires an artificial urinary sphincter (AUS).
34 If the man still has storage LUTS together with incontinence, he will not undergo
35 further de-obstructive surgery, therefore he will remain in this health state
36 throughout the model.

37 Men who initially had a successful outcome can have deterioration in symptoms
38 and end up with residual LUTS state. Some of them will undergo further de-
39 obstructive surgery if incontinence is not present, and some will be medically
40 treated. The second surgery is always TURP, even in the HoLEP arm, as the
41 experts in the GDG believe that HoLEP is unlikely to be performed twice. We

1 varied the structure between the two arms in a structural sensitivity analysis
 2 where we assumed TURP was not possible after HoLEP either.

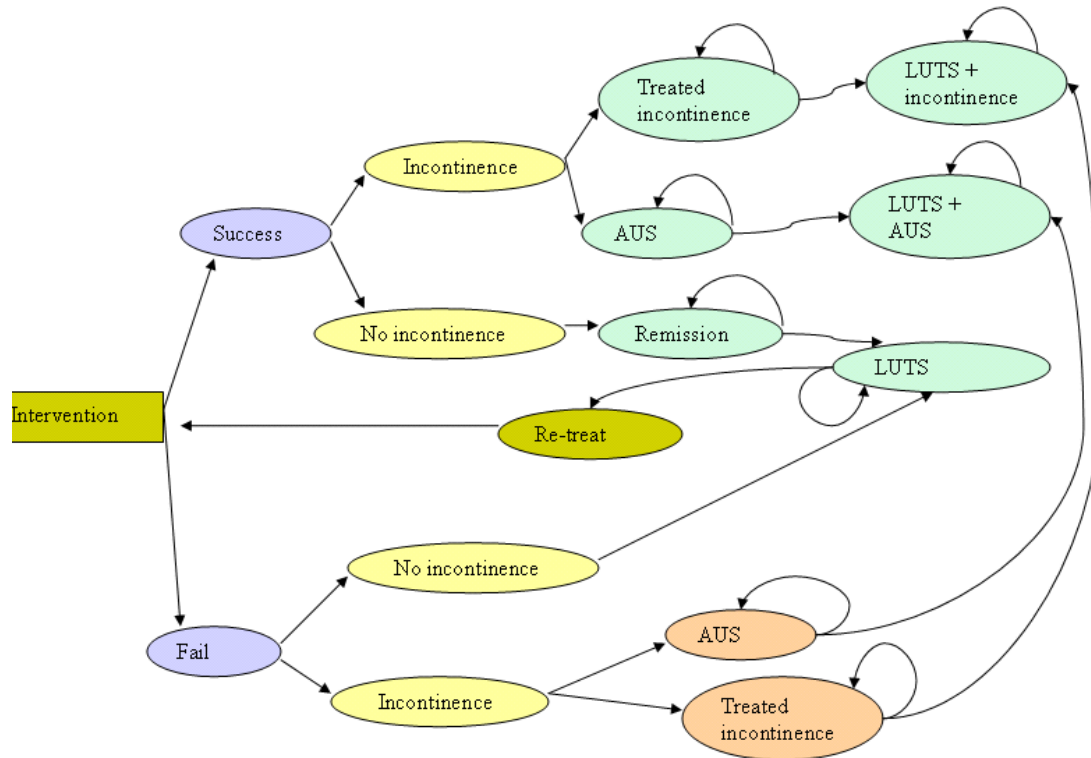

3 The list of the health states that are part of the model is reported in Table 1.

4 **Table 1 - Health states**

HEALTH STATES
(Moderate-to-Severe) LUTS
Remission
LUTS + Incontinence
LUTS + Incontinence AUS
Incontinence
Incontinence AUS

5

6 The experts of the GDG members have defined a significant remission of
 7 symptoms after surgery as a change in IPSS greater than five. This was agreed
 8 after considering that the minimally important difference is estimated as 3
 9 points²⁴ but a more consistent improvement is expected after an invasive
 10 intervention. It was agreed that a change by 5 points would constitute a
 11 treatment success.

1

2 **Figure 236 - Model structure. The health states are represented by the six blue circles on**
 3 **the top right corner. The arrows represent the possible transitions from a state to another**
 4 **or to the same state.**

5

6 For each strategy the expected healthcare costs and expected QALYs were
 7 calculated by estimating the costs and QALYs for each state and then multiplying
 8 them by the proportion of patients who would be in that state as determined by
 9 the strategy taken.

10 We performed a probabilistic sensitivity analysis (SA) to test the robustness of
 11 the results against the imprecision of these estimates and the other model
 12 parameters, and to obtain more accurate estimates of expected costs and
 13 QALYs.

14 We identified sensitive parameters with a threshold analysis and then conducted
 15 multi-way sensitivity analyses on those parameters at decision point.

16 10.3.2 Key assumptions

17 The experts in the GDG were consulted in order to make the following
 18 assumptions:

19 a) After a relapse in symptoms, only 5% of patients will undergo a second
 20 TURP. The remaining 95% are treated medically.

21 b) The probability of success of the same intervention when performed a
 22 second time is 75% the probability of success when performed for the
 23 first time.

- 1 c) The proportion of men with incontinence after surgery/laser requiring an
 2 AUS is 5%. The remaining 95% are treated medically or with
 3 incontinence products (catheters, pads, etc).

4 10.3.3 Probability of success - TURP

5 We searched for an RCT which reported the probability of success of either
 6 TURP or HoLEP as defined in our model (change in IPSS \geq 5). We found only one
 7 large multicentre RCT⁹⁴ where 120 of the randomised patients received TURP
 8 while the other 115 received TUVP. Data from this study⁹⁴ that were used in the
 9 model are reported in Table 2.

10 **Table 2 - Data on TURP used in the model (a)**

	Data used in the model
IPSS at baseline (IPSS pre)	20.7 (SD 6.9)
IPSS at 6 months (IPSS post)	6.9 (SD 5.5)
Probability of success of TURP at 6 months	85.4%
Probability of success of TURP at 24 months	84.0%

11 (a) From Fowler et al. (2005)⁹⁴

12

13 10.3.4 Probability of success - HoLEP

14 We could not find similar data for HoLEP so we adopted an alternative
 15 approach, linking the probability of success of the two interventions using the
 16 IPSS change data from our clinical review.

17 **Table 3 - Effectiveness from meta-analysis**

	HoLEP vs. TURP
Weighted Mean Difference (WMD) from baseline IPSS at 6 months	- 0.52
WMD from baseline IPSS at 24 months	- 0.80

18

19 10.3.4.1 Setting up the precondition

20 IPSS_{post} is the mean IPSS after the intervention and it is equal to:

21 I $IPSS_{post} = P_{success} * IPSS_{success} + (1 - P_{success}) * IPSS_{fail}$

22 Where IPSS_{fail} and IPSS_{success} are respectively the mean IPSS in the group of
 23 patients whose treatment has failed and the mean IPSS in the group of patients
 24 whose treatment was successful.

1 By assuming that IPSS_{fail} is the same for both TURP and HoLEP and also that
2 IPSS_{success} is the same for both, we can estimate the success rate for HoLEP.

3 **10.3.4.2 Deriving IPSS after a TURP failure**

4 **II** $IPSS_{fail} = IPSS_{pre} - \Delta IPSS_{fail}$

5 Where $\Delta IPSS_{fail}$ is the change in IPSS in patients for whom the intervention has
6 failed. By definition this must be ≤ 4 . Assuming in some patients the symptoms
7 might have deteriorated, we can consider the range -1 to 4, and use the central
8 value 1.5, which is then varied in a sensitivity analysis. Substituting this value in II
9 and using the data from TURP we get $IPSS_{fail} = 20.7 - 1.5 = 19.2$

10 **10.3.4.3 Deriving IPSS after a successful TURP**

11 We can rearrange equation I as

12 **III** $IPSS_{success} = (IPSS_{post} - (1 - P_{success}) \times IPSS_{fail}) / P_{success}$

13 Using data from Table 2 and our result for IPSS_{fail} from 10.3.4.2 we get:

14 **IV** $IPSS_{success} = (6.9 - 14.6\% \times 19.2) / 85.4\% = 4.8$

15 **10.3.4.4 Deriving IPSS after HoLEP**

16 The mean difference in change in IPSS from baseline to 6 months was -0.52
17 compared with TURP (Chapter 8.3.1). The IPSS 6 months after HoLEP is simply
18 the IPSS at 6 months for TURP plus this difference:

19 **V** $IPSS_{post} = 6.9 - 0.52 = 6.4$

20 **10.3.4.5 Calculating the probability of HoLEP success at 6 months**

21 We rearranged equation I to give us:

22 **VI** $P_{success} = (IPSS_{post} - IPSS_{fail}) / (IPSS_{success} - IPSS_{fail})$

23 Substituting the values derived above (10.3.4.2, 10.3.4.3, 10.3.4.4) we get:

24 **VII** $P_{success} = (6.4 - 19.2) / (4.8 - 19.2) = 88.9\%$

25 **10.3.5 Probability of relapse**

26 According to the data reported in Fowler et al (2005)⁹⁴, TURP was more
27 effective after 6 months than after 24 months, as only 84% of patients had an
28 improvement in symptoms by at least 5 points at 24 months compared to 85.4%
29 of patients at 6 months Table 2. To mimic what happens in real practice, where a
30 relapse in symptoms sometimes follows an initial improvement, it was necessary
31 to incorporate a time-dependant probability of relapse after an initial success.

32 The probability of relapse between these two intervals (6 months and 24 months)
33 is calculated as follows:

34 **VIII** $(P_{success\ 6\ months} - P_{success\ 24\ months}) / P_{success\ 6\ months}$

35 Which in case of TURP is equal to $(85.4\% - 84\%) / 85.4\% = 1.6\%$

1 We converted the probability of relapse of TURP over 18 months into a 3-month
2 rate, which is the cycle length of the model, by using the formula:

3 **IX** $1 - \exp((\ln(1 - \text{relapse18months}))/6)$

4 We used the same probability of relapse for HoLEP (a conservative assumption).

5 **10.3.6 Probability of complications**

6 Several complications of HoLEP and TURP were identified in the systematic
7 review (Appendix E). In our economic model we only included those that would
8 require additional treatment and generate additional costs.

9 To calculate the probability of complications following TURP (Table 4), we
10 aggregated data from the TURP arm in every study included in our review,
11 excluding the duplicates. We then compared the incidences of adverse events
12 after TURP with those reported in the AUA¹⁴ and we found no considerable
13 difference.

14 The incidence of complications following HoLEP (Table 4) was estimated by
15 multiplying their probability after TURP by the risk ratio (RR) of HoLEP compared
16 to TURP.

17 **Table 4 - Probability of complications**

	TURP	HoLEP	
	Probability	RR vs. TURP	Probability
Incontinence	4.0%	1.19	4.8%
Blood transfusion	6.2%	0.27	1.8%
Acute urinary retention (AUR)	3.9%	0.71	2.8%
Urinary tract infections	6.9%	0.45	3.1%
Transurethral syndrome	2.0%	0.31	0.6%
Strictures	7.2%	0.69	5.0%

18

19 All the adverse events were assumed to occur within three months after the
20 intervention, and so within the same cycle in the model. All of them have
21 associated one-off costs (see 10.3.11) and no detriment in quality of life with the
22 exception of incontinence which has a lifetime cost and disutility (10.3.8).

23 **10.3.7 Life expectancy**

24 The mean age of the men when entering the model was 71 as this was the mean
25 age of men in the diagnosis-related group 'Hyperplasia of prostate' in the
26 Hospital Episode Statistics 2006/07.

27 Life expectancy in patients with LUTS was assumed to be the same as the
28 general population in England and Wales. The remaining life expectancy for
29 men aged 71 is 12.99 years, as reported in the Life Tables for the general

1 population of England and Wales in the year 2005-2007 from the Government
2 Actuary Department
3 ([http://www.gad.gov.uk/Documents/Demography/EOL/ILT%202005-](http://www.gad.gov.uk/Documents/Demography/EOL/ILT%202005-07/wltewm0507.xls)
4 [07/wltewm0507.xls](http://www.gad.gov.uk/Documents/Demography/EOL/ILT%202005-07/wltewm0507.xls)).

5 **10.3.8 Quality of life**

6 The utility scores in Table 5 are a measure of the quality of life associated with
7 LUTS and incontinence. A systematic search for quality of life in men with LUTS
8 and with incontinence was performed (Appendix C). Studies were included if
9 they reported utility values for the states of LUTS or incontinence.

10 Studies reporting utilities specific to non-compared interventions were excluded.

11 Two studies^{21,198} were excluded because the values were obtained from
12 consensus rather than from patients or general public.

13 Kok et al (2002)¹⁴⁹ reported utility values according to the obstructive and
14 irritative dimension of IPSS. However, using this study to estimate an average
15 utility score for LUTS would have required further assumptions on the nature of
16 the symptoms.

17 Ackerman et al (2000)⁸ assessed the preference of 13 patients to health states
18 with the standard gamble technique. We excluded this study due to the small
19 sample size but we used it as an alternative source of data in the sensitivity
20 analysis.

21 Trueman et al (1999)²⁹⁷ designed a survey to collect EQ-5D scores by symptoms
22 severity in 1115 men in the UK. The results of this study²⁹⁷ were used in our
23 model and are reported in Table 5. Although the population in the model is
24 made of men with moderate-to-severe LUTS we used the utility value for severe
25 LUTS as 20.7 was the average IPSS of this population.

26 We found a UK study⁵⁸ reporting the deterioration in quality of life caused by
27 incontinence. A multivariate analysis of EQ-5D scores, found that after controlling
28 for age, gender and body mass index, incontinence was associated with a
29 reduction in the EQ-5D score by 0.11 (SE 0.026). This value was subtracted from
30 the remission and LUTS utility scores for the health states respectively
31 characterised by symptoms remission and Incontinence and LUTS and
32 Incontinence. The values thus obtained are reported in Table 5.

33 Among patients with incontinence, 5% require an artificial urinary sphincter while
34 the remaining 95% are treated pharmacologically or with incontinence products.
35 The utility score does not differ for these two subgroups.

36 Other adverse events were assumed to be negligible in terms of quality of life
37 because they could be promptly treated.

38

4

5

6 10.3.9 Calculating QALYs gained

7

For each strategy, the expected QALYs in each cycle are calculated as follows:

8

$$X \text{ Expected QALYs} = \sum (U_i \times P_i)$$

9

where

10

U_i = the utility score for health state i

11

P_i = the proportion of patients in health state i

12

and where health state i could be any of the health states reported in Table 1.

13

The proportion of patients in each health state depends on the effectiveness of the treatment, in terms of symptoms improvement and incontinence, and on the proportion of patients still alive, which falls as the number of cycles and therefore age increases.

16

17

The overall *lifetime expected QALYs* are given by the sum of QALYs calculated for each cycle. The *incremental QALYs gained* associated with a treatment strategy are calculated as the difference between the expected QALYs with that strategy and the expected QALYs with the comparator.

20

21 10.3.10 Cost of interventions

22

We adopted a bottom-up approach to calculate the intervention cost as differentiating the total costs for the two intervention was not possible by using national sources (NHS Reference Costs or Tariffs) or published evidence. In fact, no UK study could be found which reported the cost of HoLEP as this is performed only in a few UK centres only while TURP is a widespread technique. For this reason we decided to include only the capital cost of the HoLEP equipment as the TURP equipment is already present in every Urology centre. Only disposables used in TURP were included in the calculation.

29

30

We contacted the UK supplier of HoLEP equipment (SIGMACON) to obtain precise data on the cost of the machine and the cost and number of uses of disposables. We assumed the life span of the machine is 10 years. As we want

31

32

1 to estimate the cost of the machine per patient, the GDG had to estimate the
2 number of patients per centre undergoing surgery for LUTS in a year.

3 We found the cost of TURP disposables in a study⁹⁴ and the GDG estimated the
4 number of uses. The data thus collected are reported in Table 6.

5 In addition to the cost of equipment, other factors influencing the total costs are
6 the operating theatre cost, the length of stay after the intervention, and the
7 complications. The costs of operating theatre and hospital stay are reported in
8 Table 6 while the costs of complications are described in 10.3.11.

9 **Table 6 – Resources used and costs**

	HoLEP	Source
Cost of HoLEP machine	£150,000	UK supplier (SIGMACON)
Lifespan of HoLEP	10 years	Assumption
Number of patients per year per HoLEP machine	280	Expert opinion
Cost of morcellator blades (HoLEP)	£595 each	UK supplier (SIGMACON)
Number of uses per blade	10	UK supplier (SIGMACON)
Cost of fibres (HoLEP)	£550 each	UK supplier (SIGMACON)
Number of uses per fibre	20	UK supplier (SIGMACON)
Cost of loops (TURP)	£47	Expert opinion
Number of uses per loop	10	Expert opinion
Operating time TURP	60 minutes	Systematic review (Appendix E) (a)
Operating time HoLEP	75 minutes	Systematic review (Appendix E) (a)
Cost of urology operating theatre	£9 per minute	Local cost estimate
Median length of hospital stay after TURP (b)	3 days	Hospital Episode Statistics 2006/07
Median length of hospital stay after HoLEP (b)	2 days	Hospital Episode Statistics 2006/07
Mean cost per bed day	£204	National Schedule of Reference Costs 2006-07 for NHS Trust & PCT Combined – HRG LB25C

10 (a) Mean number of times reported in Gupta et al (2006)¹⁰⁸ and Montorsi et al (2004)²⁰².

11 (b) The median was used as an estimate of the mean to exclude outliers probably due to
12 complications.
13

14 The annual cost of the HoLEP machine is a function of the capital cost of the
15 machine, its life span and the discount rate according to the formula:

1 **XI** $E = K*r/[1-(1+r)^{-n}]$

2 where E = annual cost of the machine

3 K = capital outlay (cost of purchasing the machine)

4 r = discount rate / interest rate = 3.5%

5 n = lifespan

6 The total cost of a single intervention can be represented by the formula:

7 **XII** $TC_i = E/np + cDisp_i + opT_i*cTheatre + cComp * pComp_{A-i}$

8 Where TC_i = total cost of the intervention i

9 E = annual cost of machine (only HoLEP)

10 np = number of patients using the machine per year

11 cDisp_i = cost of disposables of intervention i

12 opT_i = operating time of intervention i

13 cTheatre = cost of theatre per minute

14 cComp_A = cost of treating complication A (Table 7)

15 pComp_{A-i} = probability of complication A after intervention i (Table 4)

16 where i is either TURP or HoLEP and A is any complication described in Table 7.

17 **10.3.11 Cost of complications**

18 The complications included in the model and their probabilities are reported in
 19 10.3.6. The GDG estimated the resources used to treat each complication as
 20 shown in Table 7 with the exception of acute urinary retention for which we used
 21 a UK economic study¹⁷. When a procedure could be performed as a daycase or
 22 inpatient, we checked this proportion in the Hospital Episode Statistics 2006/07
 23 ².

24 **Table 7 - Cost of complications**

	COST	SOURCE
Blood transfusion	£635 (a)	Varney et al (2003) ³¹⁰
Stricture	£706 (b)	National Schedule of Reference Costs 2006-07 – HRG code LB30B
Acute urinary retention	£2,029 (c)	Annemans et al (2005) ¹⁷
Trans-urethral syndrome	£1,710 (d)	National Schedule of Reference Costs 2006-07: 1) High Dependency Unit – 0 organs supported XC07ZHDU; plus 2) Excess bed day - HRG LB25C

Urinary tract infections	£742 (e)	National Schedule of Reference Costs 2006-07– HRG code LA04C
---------------------------------	----------	--

- 1 (a) cost of a transfusion of red blood cells
2 (b) weighted cost - £509 x 54%(daycase) + £938 x 46%(inpatient)
3 (c) cost of the most cost-effective intervention to treat AUR in the study
4 (d) cost of two days in HDU and two days in normal ward
5 (e) weighted cost - £376 x 10%(daycase) + £783 x 90%(inpatient)
6

7 Incontinence is a complication but it is also a health state in the model so its cost is
8 calculated separately in 10.3.12.

9 10.3.12 Cost of health states

10 The possible health states in which a patient could be in the model are listed in Table
11 1. By collecting information on the resources used while in these states from the GDG
12 experts, we calculated the costs reported in Table 8.

13 When the patient has a remission of symptoms, we assumed no further treatment would
14 be necessary and this state has no cost associated.

15 If after the intervention a patient still has LUTS, he would undergo urodynamic studies
16 to investigate the cause of the intervention failure. He would then be treated with
17 either anticholinergics or alpha-blockers and be recalled for a visit every six months.
18 We assumed that 50% would be treated with anticholinergics and 50% with alpha-
19 blockers. The details of the cost calculations are reported in Table 8.

20 **Table 8 - Cost of residual LUTS state**

Resources used	Proportion of patients using the resource	Unit cost of resource	Total cost per month per patient
Alpha-blockers	50%	£0.35 (a)	£5.32
5mg Oxybutynin twice daily	25%	£0.39 (b)	£5.93
Other Anticholinergics	25%	£1.05 (c)	£15.97
One visit every 6 months	100%	£75 (d)	12.50
TOTAL			£39.72
Urodynamic studies (one-off)	100%	£165 (e)	-

- 21 (a) Average cost per day of Alfuzosin, Tamsulosin, Doxazosin, and Prazosin (BNF 57)
22 (b) Cost of treatment per day (BNF 57)
23 (c) Average cost per day of Darifenacin, Solifenacin, Tolterodine, Trospium, Propiverine and Fesoterodine
24 (BNF 57)
25 (d) From National Schedule of Reference Costs 2006-07– Consultant led follow-up attendance –
26 outpatient face-to-face – Urology
27 (e) From National Schedule of Reference Costs 2006-07 - Outpatient procedure LB42Z
28

29 To estimate the cost of incontinence in men treated with drugs or products we searched
30 for UK cost-of-illness studies excluding those studies conducted in women. We did not
31 find any so we estimated the resources and their costs with the help of experts from
32 the GDG (Table 9).

1 **Table 9 - Cost of incontinence in men treated with products or drugs**

Resources used	Proportion of patients using the resource	Unit cost of resource	Total cost per month per patient (f)
3 ISC catheters per day	25%	£1.30	£29.66
1 indwelling catheter every 6 weeks	25%	£6.00	£1.08
5mg Oxybutynin twice daily	50%	£0.39 (a)	£5.93
Other anticholinergics	50%	£1.05 (b)	£15.97
1 pad a day	25%	£0.34	£2.58
1 leg bag per week	25%	£2.50	£2.71
1 overnight bag per night	25%	£0.10	£0.76
1 bag support, leg sleeve and Stalock Bard per week	25%	£6.00	£6.50
Sheath appliances	25%	£40.00 (c)	£10.00
1 district nurse visit per week	100%	£21.00 (d)	£91.00
1 specialist nurse visit every 6 months	100%	£66.00 (e)	£11.00
TOTAL			£177.19

- 2 (a) Cost of treatment per day (BNF 57)
3 (b) Average cost per day of Darifenacin, Solifenacin, Tolterodine, Trospium, Propiverine and Fesoterodine
4 (BNF 57)
5 (c) Estimate on cost per month rather than number of items.
6 (d) From Curtis (2008)⁵⁹ – cost of district nurse per home visit including travel, excluding qualification
7 (e) From Curtis (2008)⁵⁹ – cost of specialist nurse per hour of client contact, excluding qualification
8 (f) These figures account for the proportion of patients who use that resource
9

10 In the model, 5% of the men with incontinence have an AUS implanted. The costs
11 associated with this intervention are the one-off cost of urodynamic studies, the cost of
12 implanting the AUS and the recurrent visits. The AUS needs to be re-implanted on
13 average every ten years and this is taken into account in the model with a recurrent
14 cost of the operation (Table 10).

15 **Table 10 - Cost of artificial urinary sphincter (AUS)**

Resources used	Frequency	Unit cost of resource	Source of cost
AUS implant	10 years	£4,137	National Schedule of Reference Costs 2006-07– HRG code LB21Z
Urology visit	6 months	£75	National Schedule of Reference Costs 2006-07– Consultant led follow-up attendance – outpatient face-to-face – Urology
Urodynamic studies	One-off	£165	National Schedule of Reference Costs 2006-07 - Outpatient procedure LB42Z

1
2 The costs associated with the ‘LUTS + Incontinence’ state are similar to the costs of the
3 Incontinence state, while the ‘LUTS + Incontinence AUS’ state generates the same costs
4 as the ‘LUTS+Incontinence AUS’ state with the addition of the anticholinergics (in 50%
5 of the men) and alpha-blockers (in the other 50%).

6 For each strategy, the expected cost per cohort of patients is calculated as follows:

7 **XIII** Expected cost = $C_s + \sum_{j=1}^{40} \sum_{i=1}^6 C_i P_{ij}$

8

9 where

10 C_s = cost of the initial strategy (TURP or HoLEP)

11 C_i = cost of health state i

12 P_{ij} = proportion of patients in health state i in cycle j

13 and where health state i could be any stage in Table 1.

14 The proportion of patients in a health state depends on the magnitude of the
15 improvement in symptoms specific to each treatment, its probability of causing
16 incontinence, and on the proportion of patients still alive according to the mortality
17 rate for the general population of England and Wales.

18 The overall lifetime expected costs are given by the sum of costs calculated for each
19 cycle. The incremental cost associated with a treatment strategy is calculated as the
20 difference between the expected cost with that strategy and the expected cost with
21 the comparator.

22 **10.3.13 Probabilistic sensitivity analysis**

23 A probabilistic sensitivity analysis was performed to assess the robustness of the model
24 results to plausible variations in the model parameters.

25 Probability distributions were assigned to each model parameter, where there was
26 some measure of parameter variability (Table 11). We then re-calculated the main
27 results 10000 times, and each time all the model parameters were set simultaneously,
28 selecting from the respective parameter distribution at random.

29 **Table 11 - Parameters and distributions used in the probabilistic sensitivity analysis**

Description of variable	Mean value	Probability distribution	Parameters	Source
IPSS post treatment with TURP after 6 months	6.9	Normal	SD = 0.5102	Fowler et al (2005) ⁹⁴
IPSS post treatment with TURP after 2 years	7.5	Normal	SD = 0.6633	Fowler et al (2005) ⁹⁴
Initial IPSS	20.7	Normal	SD=0.6633	Fowler et al (2005) ⁹⁴

IPSS change when treatment fails	1.5	Triangular	Min=0 Likeliest=1.5 Max=3	Assumption

Utility of severe LUTS	0.71	Beta	$\alpha = 80.23$ $\beta = 32.77$	Trueman et al (1999) ²⁹⁷

Utility of Remission	0.91	Beta	$\alpha = 33.67$ $\beta = 3.33$	Trueman et al (1999) ²⁹⁷
Disutility from incontinence	0.11	Normal	SD = 0.026	Currie et al (2006) ⁵⁸
Effectiveness when procedure is performed the second time compared to first time	75%	Triangular	Min=50% Likeliest=75% Max=100%	Experts opinion
Discount rate (cost and QALYs)	3.5%	None		

1 (a) We approximated the standard error (SE) of the mean by assuming the width of the 95% CI was 50%
2 of the mean using the following equation: $SE=0.25 \times \text{mean} / Z_{0.0975}$

3 (b) Based on experts opinion

4 (c) We used the interquartile range (IQR) to approximately estimate the SE of the mean using the following
5 equation: $SE=0.5 \times \text{IQR} / Z_{0.75}$

6 (d) Based on the range from HES 2006/07

7 10.3.14 Results of the cost-effectiveness analysis

8 We analysed the data deterministically (Table 12) and probabilistically (Table
9 13). We found that the results of the model were sensitive to various parameters
10 and this is reflected in the extreme confidence intervals obtained with the
11 probabilistic SA.

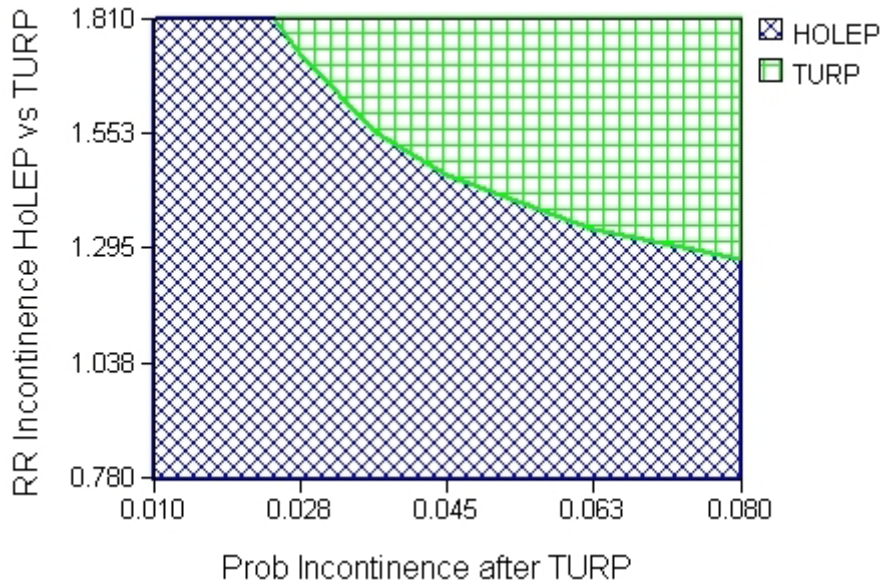

12 In the base case analysis HoLEP is more cost-effective than TURP but this result is
13 overthrown by minimal changes in variables (Table 12).

14 **Table 12 - HoLEP vs. TURP - Results of base case analysis**

	Mean cost (£)	QALYs	Incremental cost per QALY gained (HoLEP vs. TURP)	Sensitivity analysis
TURP	2,938	8.5761	-	TURP is cost-effective if: - probability that TURP fails <12% - probability that HoLEP fails >13.5% - RR of Incontinence (Holep vs TURP) >1.51 - WMD in IPSS change <0.17 - TURP is not possible after HoLEP - probability of incontinence after TURP and RR incontinence (HoLEP/TURP) are varied together (Figure 237).
HoLEP	2,920	8.6019	HoLEP dominates (a)	

15 (a) HoLEP dominates means that HoLEP is both more effective and less costly. Hence the ICER cannot be
16 calculated.

17

1
2
3
4
5
6

Figure 237 - Two-way sensitivity analysis of probability of incontinence after TURP and RR of Incontinence HoLEP vs TURP. The green and blue areas of the graph represent respectively the combinations of the two parameters where TURP or HoLEP is cost-effective.

7
8

The instability of this conclusion is even more evident from the results of the probabilistic SA (Table 13).

9

Table 13 - Probabilistic SA results - HoLEP vs. TURP

Mean incremental cost/mean QALYs gained	95% CI – lower limit (£/QALY)	95% CI – upper limit (£/QALY)	Probability of being cost-effective at £20,000/QALY
TURP dominates (a)	HoLEP dominates	TURP dominates	HoLEP 48% TURP 52%

10
11

(a) TURP dominates means that TURP is both more effective and less costly. Hence the ICER cannot be calculated.

12

13
14
15
16

The probability of HoLEP being cost-effective (48%) is very close to the probability of TURP being cost-effective (52%) at a willingness to pay of £20,000/QALY (the NICE threshold). The probabilities are very similar for other willingness to pay thresholds (Figure 238).

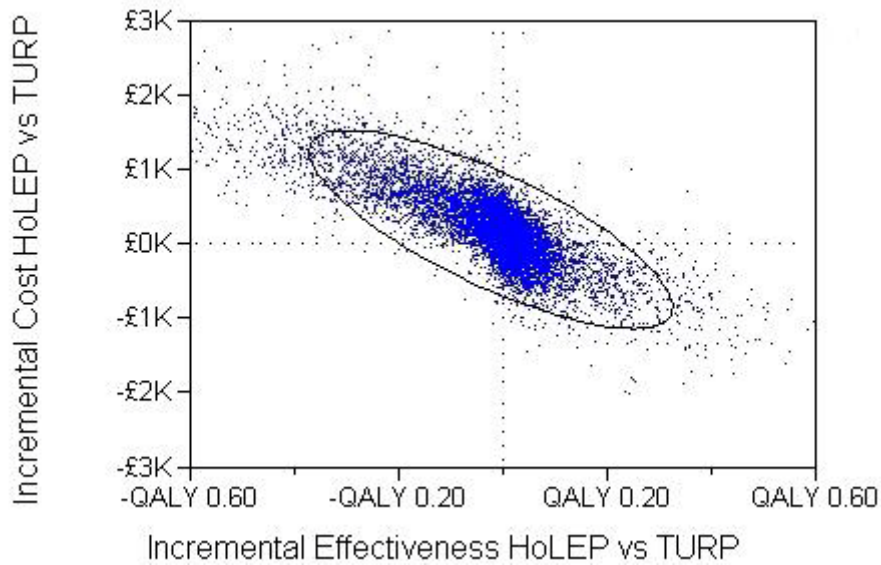

1

2 **Figure 238 - Acceptability curve of HoLEP and TURP**

3

4 The uncertainty can also be graphically represented by plotting the results of the
 5 incremental analysis for all the 10,000 simulations into a cost-effectiveness plane
 6 (Figure 239). Each point represents the ICER of TURP vs. HoLEP for each
 7 simulation. The dotted line represents the £20,000/QALY threshold while the
 8 ellipse delimits the 95% confidence interval.

9

10 **Figure 239 - Incremental cost-effectiveness scatterplot - HoLEP vs TURP**

1

2 **10.3.15 Discussion**

3 HoLEP and TURP could be equally cost-effective.

4 TURP is the current standard of care in the UK while HoLEP is a relatively new
5 technique practiced in a small number of UK centres. Although our analysis shows
6 that HoLEP is at least as cost-effective as TURP, careful considerations should be
7 given to recommending its widespread use.

8 The cost-effectiveness of HoLEP seems to be associated with the skills of the
9 surgeons as the probabilities of complications depend on the expertise of the
10 surgeon performing the operation. The probabilities as reported in the studies
11 included in our clinical review, where HoLEP was performed by specialised
12 surgeons, might be largely different from the actual events following an
13 operation performed by a trainee surgeon. Therefore we might have
14 overestimated the effectiveness of HoLEP.

15 Another overestimation might be due to the blood transfusion rate after TURP as
16 estimated from our review of clinical studies. Some of the included studies¹⁴⁵
17 reported a blood transfusion rate after TURP higher than the average.

18 The major limitation of our model is the arbitrary definition of success (IPSS
19 change of at least 5 points). Although other authors⁹⁴ have adopted this
20 definition, it is still debatable whether a change of 5 points could be considered
21 a remission in symptoms. Other authors¹⁷² have used an improvement by 10% in
22 IPSS as a proxy for success but this was judged to be even more optimistic by
23 our experts, as this would equate to 2 points of improvement when the baseline
24 score is 20.

25 The results of our study are based on trial data for men with moderate-to-severe
26 symptoms with a mean baseline IPSS of 20.7. For men with less severe symptoms,
27 TURP might be more cost-effective as it is less costly, while for men with more
28 severe symptoms HoLEP might be more cost-effective as it is more effective than
29 TURP at improving symptoms.

30 We compared the results of our study with the economic analysis from the
31 HTA¹⁷² included in our review and we found similar results and conclusions. In this
32 study¹⁷², HoLEP was more effective and less costly than TURP but the results were
33 highly sensitive to several parameters. Unlike this study¹⁷² our model takes into
34 account the capital cost of HoLEP which might explain the higher cost of HoLEP
35 compared to TURP in the mean results of the probabilistic analysis.

36 From an NHS perspective, the results of our study would suggest training new
37 surgeons in HoLEP could improve outcomes and save costs if performed correctly.
38 However, a shift from TURP to HoLEP would have to be gradual for it to be cost-
39 effective since purchasing the new equipment might not warrant the improved
40 outcomes which were marginal. It is important to note that there is still
41 inadequate long-term data for HoLEP. However, if a centre has to replace old
42 equipment and surgeons trained in HoLEP are available, HoLEP could be an
43 efficient option.

1 In conclusion, given the learning curve associated with the new technique and the
2 cost of purchasing the new equipment, the GDG felt it was reasonable to
3 recommend HoLEP only in centres specialised in the technique.

4 **10.3.16 Conclusions**

- 5 • HoLEP and TURP are similarly cost-effective
- 6 • In settings where HoLEP is not currently performed, TURP is more cost-
7 effective because of the capital cost and the learning curve

8

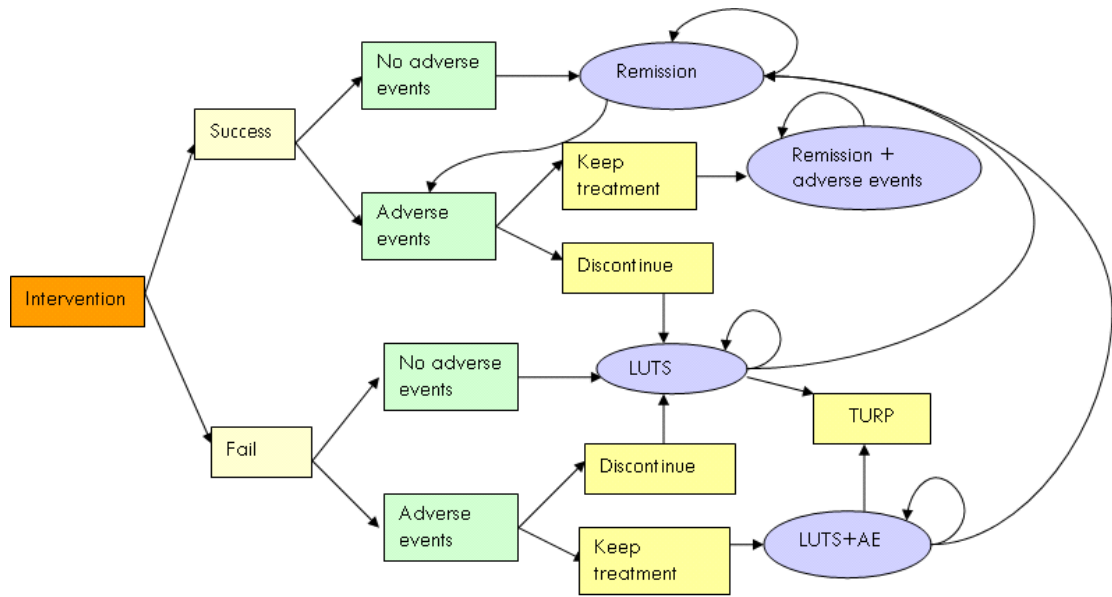

9 **10.4 NCGC Combination model**

10 An economic model comparing Alpha-Blockers (AB) with a combination of AB and
11 5-Alpha-Reductase Inhibitors (Comb) was developed further to the exclusion of
12 any economic evidence focusing on this comparison. The main outcomes
13 considered were the change in IPSS from baseline and the treatment adverse
14 events which were expressed in quality of life measures. Patients in this model
15 are men who have moderate lower urinary tract symptoms and are selected for
16 medical treatment. Studies specifically conducted on patients with a prostate size
17 larger than the average^{191,263} were not used to estimate IPSS change as it was
18 the GDG opinion that this would have favoured the Combination intervention.

19 We built a Markov model with a lifetime horizon (Figure 240) and we chose a
20 cycle length of six months as it was the shortest follow up period in our clinical
21 review of effectiveness (Chapter 6.10.1). All the probabilities, costs and health
22 utilities were converted in order to reflect the six-month values. The time horizon
23 was shortened to 5 years in a sensitivity analysis.

24 After a treatment period of six months, men can have either a meaningful
25 improvement in IPSS (treatment success) or a negligible/no improvement
26 (treatment failure). During this period they can also experience various adverse
27 events which are independent from the treatment success. However, a proportion
28 of those men experiencing adverse events will discontinue treatment, going back
29 to the LUTS state. Men who had a treatment failure to start with will go to the
30 LUTS state (with or without adverse events) but they can still have an
31 improvement in the following six month cycle. Some men in the LUTS state will
32 undergo TURP and they will feed into the TURP model (10.3).

33

1

2 **Figure 240 - Structure of the combination model. The squared boxes represent the chance**
 3 **nodes in the model while the circles are the possible health states.**

4

5 The list of the health states that are part of the combination model is reported in
 6 Table 14.

7 **Table 14 - Health states of combination model**

HEALTH STATES
(Moderate) LUTS
Remission
LUTS +adverse events
Remission + adverse events
TURP

8

9 While in the Surgery model a significant remission of symptoms was a change in
 10 IPSS greater than five, in the Combination model we used the 3 point estimate
 11 by Barry et al (1995)²⁴.

12 For each strategy the expected healthcare costs and expected QALYs were
 13 calculated by estimating the costs and QALYs for each state and then multiplying
 14 them by the proportion of patients who would be in that state as determined by
 15 the strategy taken.

16 We performed a probabilistic sensitivity analysis (PSA) to test the robustness of
 17 the results against the imprecision of these estimates and the other model
 18 parameters, and to obtain more accurate estimates of expected costs and
 19 QALYs.

10.4.1 Key assumptions

The experts in the GDG were consulted in order to make the following assumptions:

- a) Patients are kept on treatment for all their life if the treatment is effective and there are no adverse events.
- b) If the treatment does not work (i.e. IPSS improves by less than 3 points) the treatment is kept for one year then it is discontinued.
- c) 50% of the patients who discontinue the treatment after one year undergo TURP.
- d) If adverse events have not occurred during the first two years, they will never occur.

The following assumption was based on the conclusions of our clinical review:

- a) After the first year the treatment effectiveness is stable (no improvement or deterioration in IPSS are possible).

10.4.2 Probability of success

We could not find any studies reporting the proportion of successful treatment where success was defined as an improvement of at least 3 points of IPSS. We assumed that the IPSS change was normally distributed and we used the standard deviation (SD) from the mean to obtain the proportion of cases within the 3-point cut-off (Table 15). This was calculated as:

Success rate = $1 - \Phi_{\mu\sigma^2}(\text{IPSS})$ where IPSS=3,

where μ =mean IPSS, σ^2 =IPSS variance= IPSS SD squared (Table 15), 3 is the IPSS cut-off for success and where $\Phi_{\mu\sigma^2}(\text{IPSS})$ gives the cumulative distribution function for a normal distribution with mean μ and variance σ^2 .

Table 15 - Probability of treatment success when the cut-off is 3 points

	Mean IPSS change (a)	SD of IPSS change (a)	Proportion of treatment success
AB – 6 months	6.3	5.8	72%
Comb – 6 months	6.1	7.4	66%
AB – 12 months	7.1	5.7	76%
Comb – 12 months	7.3	5.8	77%

a) Source: clinical review.

As the figures in Table 15 suggest, treatment success is more likely achieved at 12 months than 6 months. Therefore men in the model for whom treatment has failed in the first six months can still experience a remission in the following 6 months. The probability of remission is simply the difference between the probability of success at 12 months and the probability of success at 6 months (Table 16).

Table 16 - Probability of symptoms remission at 12 months

	P success 6 months	P success 12 months	P remission between 6 and 12 months (a)
AB	72%	76%	14.3%
Comb	66%	77%	16.6%

a) $(P \text{ success } 12 \text{ months} - P \text{ success } 6 \text{ months}) / (1 - P \text{ success } 6 \text{ months})$

We changed the definition of success in sensitivity analyses where we defined success as an improvement by at least 5 or at least 8 points.

10.4.3 Probability of adverse events and withdrawals

We looked for RCT data on adverse events and withdrawals due to adverse events. We realised it was not feasible to estimate the incidence of specific adverse events and their specific probability of causing withdrawals from treatment. Consequently we adopted a three-step approach:

1. estimate the overall probability of a man experiencing a drug-related adverse event with AB and with combinations
2. estimate the probability of an adverse event leading to treatment discontinuation with AB and with combination
3. once an adverse event occurs, estimate the probability of specific adverse events

We found a large RCT²⁶³ reporting both drug related adverse events and drug-related adverse events leading to study withdrawals. With these data (Table 17) we were able to perform step 1 and 2 (Table 17).

Table 17 - Probability of discontinuation in patients with adverse events*

	Number of drug-related adverse events x	Number of drug-related adverse events leading to withdrawal y	Probability of drug-related adverse events	Probability of discontinuation in patients with adverse events $z=y/x$

AB	258	48	16%	18.6%
Comb	386	80	24%	20.7%

1 * From Roehrborn et al (2008)²⁶³

2

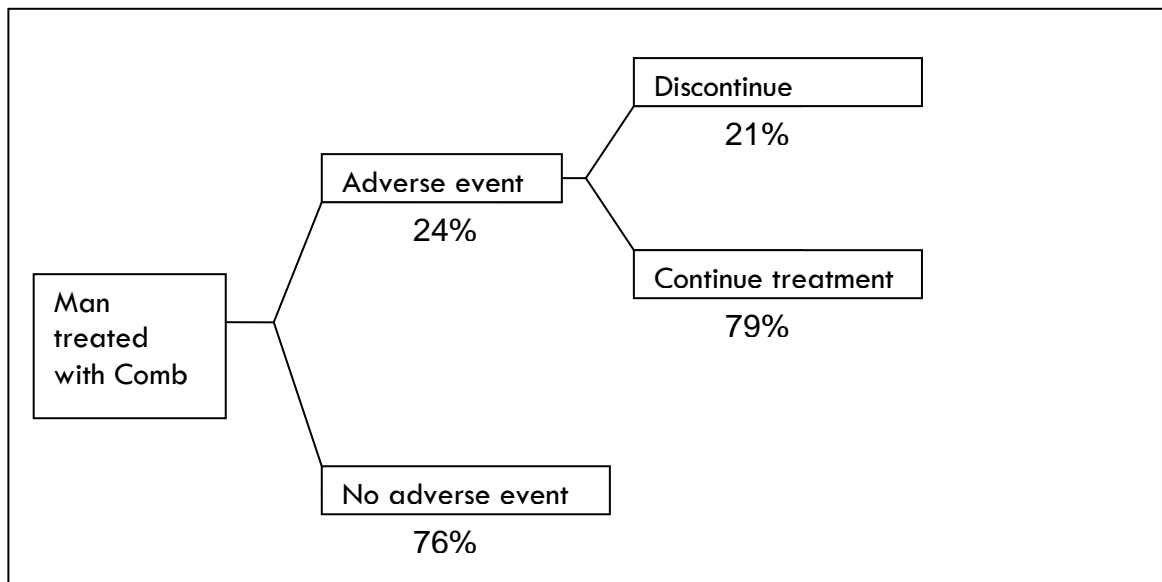

3 Figure 241 and Figure 242 illustrate how these values were used in the model.

4

5 **Figure 241 - Adverse events in the AB arm of the model**

6

7

8 **Figure 242 - Adverse events in the combination arm of the model**

9 For step 3 we used the evidence from the review of clinical effectiveness
 10 (Chapter 6.10.1). Various adverse events were reported in the included studies
 11 and in order to avoid double-counting we grouped those adverse events that
 12 could be similar in symptoms. The most common adverse event was used to
 13 represent the group (Table 18). Therefore whilst in the clinical review postural

1 hypotension, headache, syncope and dizziness are all reported, it is likely to be
 2 an overlap of those symptoms and just dizziness (the most frequent one) is
 3 reported as part of that group. Similarly decreased libido was grouped
 4 together with impotence or erectile dysfunction.

5 In our model we did not use the incidences reported in the included studies
 6 (Chapter 6.10.1) but these were used to calculate the probability of each type
 7 being the adverse event occurring (Table 18).

8 **Table 18 - Incidence and proportion of adverse events**

	Incidence		Proportion of adverse events	
	AB	Comb	AB	Comb
	X_i	Y_i	$X_i/\sum X_i$	$Y_i/\sum Y_i$
Dizziness	4.8%	4.3%	22%	16%
Fatigue	3.6%	4.2%	17%	16%
Rhinitis	6.6%	7.8%	31%	29%
Ejaculatory abnormality	0.6%	3.0%	3%	11%
Impotence/erectile dysfunction	3.0%	5.9%	14%	22%
Breast enlargement	1.8%	1.4%	8%	5%
Acute urinary retention (AUR)	1.0%	0.4%	5%	1%
TOTAL	21.4%	27.0%	100%	100%

9

10 The probability of each adverse event group was used in the model to estimate
 11 the detriment in quality of life and additional costs due to adverse events (see
 12 10.4.5 and 10.4.7).

13 **10.4.4 Life expectancy**

14 Men in the Combination Model were assumed to be on average 60 years old.

15 Life expectancy in patients with LUTS was assumed to be the same as the
 16 general population in England and Wales. The remaining life expectancy for
 17 men aged 60 is 21.22 years, as reported in the Life Tables for the general
 18 population of England and Wales in the year 2005-2007 from the Government
 19 Actuary Department
 20 (<http://www.gad.gov.uk/Documents/Demography/EOL/ILT%202005-07/wltewm0507.xls>).

22 **10.4.5 Quality of life**

23 The same sources used in the Surgery Model for quality of life estimates of the
 24 residual LUTS and remission states (10.3.8) were used in the Combination Model.

1 However, while men in the Surgery Model had on average severe symptoms, in
2 the Combination Model men have moderate symptoms.

3 The health states ‘Remission + Adverse events’ and ‘LUTS + Adverse events’ are
4 made of the Remission or LUTS utility value and the disutility (decrease in utility)
5 due to adverse events.

6 Being the spectrum of adverse events in the AB arm different from that in the
7 combination arm (10.4.3), the adverse events health states will also have
8 different utility values in the different arms.

9 The utility value of the LUTS + adverse events state for intervention y will be
10 calculated as:

$$11 \quad \mathbf{XIV} \quad u_{LUTS-AE_y} = u_{LUTS} + \sum(\text{disutility}_{AE_i} * p_{AE_iy})$$

12 where u_{LUTS} is the utility values of Moderate LUTS reported in Table 19,

13 disutility_{AE_i} is the disutility of the adverse event i where i is any of the adverse
14 events reported in Table 18,

15 and $p_{AE_i,y}$ is the proportion of the adverse event i for the intervention y, where
16 y could be either AB or combination.

17 From equation **XIV** it can be deduced that the utility of these health states
18 depend on the intervention being the proportion of adverse events the variable
19 parameter.

20 We conducted a search in the CEA Registry ([https://research.tufts-](https://research.tufts-nemc.org/cear/default.aspx)
21 [nemc.org/cear/default.aspx](https://research.tufts-nemc.org/cear/default.aspx)) to find quality of life values associated with the
22 adverse events reported in Table 18.

23 Two studies^{289,311} were found which reported the one-day disutilities deriving
24 from dizziness, fatigue and rhinitis. We assumed that those symptoms were
25 experienced half the time; therefore the original value was halved in our
26 analysis (Table 19) but this assumption was varied in sensitivity analyses.

27 One study²³⁸ reported the disutility due to breast enlargement.

28 In a study by Dedhia et al (2008)⁷⁰ patients with LUTS were interviewed and
29 their time-trade off scores for various adverse events collected. The utility values
30 reported in this study were 0.71 for ejaculatory abnormality and 0.73 for
31 erectile dysfunction in men with LUTS. If we assume that the utility decrements are
32 additive, we can calculate the disutility due to these adverse events as the
33 difference of the utility of LUTS and the utility of adverse event in presence of
34 LUTS:

$$35 \quad \mathbf{XV} \quad \text{disutility}_{AE} = u_{LUTS} - u_{LUTS+AE}$$

36 By substituting the values from the study⁷⁰ in formula **XV** we obtain the disutilities
37 reported in Table 19.

1

Table 19 - Utility values used in the Combination Model

	Utility score	Source
Remission	0.91	Trueman et al (1999) ²⁹⁷
Moderate LUTS	0.78	Trueman et al (1999) ²⁹⁷
Disutility breast enlargement	- 0.05	Penson et al (2005) ²³⁸
Disutility dizziness (a)	- 0.11	Vera-Llonch et al (2008) ³¹¹
Disutility ejaculatory abnormality	-0.07	Dedhia et al (2008) ⁷⁰
Disutility fatigue (a)	-0.125	Vera-Llonch et al (2008) ³¹¹
Disutility impotence	-0.05	Dedhia et al (2008) ⁷⁰
Disutility rhinitis (a)	-0.095	Sullivan et al (2004) ²⁸⁹
Disutility AB adverse events	- 0.088	Weighted average of above disutilities
Disutility Comb adverse events	- 0.086	Weighted average of above disutilities

2

(a) Assuming symptoms are experienced half the time.

3

4

The disutility due to Acute Urinary Retention (AUR) was not included in the model as this complication was assumed to be treated and resolved within six months. The cost associated with this adverse event is already explained in the Surgery Model (see 10.3.11).

5

6

7

8

10.4.6 Calculating QALYs gained

9

See 10.3.9.

10

10.4.7 Cost of interventions and health states

11

The cost components of the health states in the model are made of the continuous cost of drug therapy and the cost of visits (Table 20). During the first six-month cycle men are treated with either AB or Combination and have a follow-up visit. The cost of the initial treatment is kept for at least another cycle unless there is a discontinuation due to adverse events. If the treatment is discontinued only the cost of a visit is included in the cost of a cycle.

12

13

14

15

16

17

Table 20 - Resources used in the health states of the model

HEALTH STATE	RESOURCES USED
Moderate LUTS - initial	Drugs (AB or Comb) + 1 follow-up visit
Moderate LUTS - residual	1 follow-up visit

Remission	Drugs (AB or Comb)
LUTS +adverse events	1 follow-up visit
Remission + adverse events	Drugs (AB or Comb)

1

2 The cost details of the resources used in the health states are reported in Table
3 21.

4 **Table 21 - Cost of resources used**

Resource	Total cost per patient over six months	Source
Alpha-blockers	£65	BNF 57 (a)
Combination (5-ARI+AB)	£186	BNF 57 (b)
Follow-up visit	£75	National Schedule of Reference Costs 2006-07– Consultant led follow-up attendance – outpatient face-to-face – Urology

5 a) Based on the average cost per day of Alfuzosin, Tamsulosin, Doxazosin, and Prazosin =£ 0.35

6 b) Based on the cost of AB and on the average cost per day of Dutasteride and Finasteride = £0.66

7

8 In addition, some costs are associated with particular events in the model: the
9 cost of treating AUR when adverse events occur (adjusted by the proportion of
10 AUR in the adverse events) and the cost of TURP if the therapy fails and the man
11 considers surgery. In this event the model feeds directly into the Surgery Model
12 described in 10.3 where the cost components are the same ones described in
13 10.3.10 and 10.3.11 for the TURP strategy.

14 10.4.8 Probabilistic sensitivity analysis

15 A probabilistic sensitivity analysis was performed to assess the robustness of the
16 model results to plausible variations in the model parameters.

17 The same method described for the Surgery Model (10.3.13) was used for the
18 Combination Model. The same parameters used in the TURP arm of the Surgery
19 Model were used in the Combination Model when men undergo TURP after a
20 treatment failure. All the other parameters and their distributions are listed in
21 Table 22.

22 **Table 22 - Parameters and distributions used in the probabilistic sensitivity analysis**

Description of variable	Mean value	Probability distribution	Parameters	Source

1 (a) We used the interquartile range (IQR) to approximately estimate the standard error (SE) of the mean
2 using the following equation: $se=0.5 \times IQR / Z_{0.75}$

3 (b) We approximated the SE of the mean by assuming the width of the 95% CI was 50% of the mean
4 using the following equation: $se=0.25 \times \text{mean} / Z_{0.975}$

5 10.4.9 Results

6 Alpha-blockers generate less cost and more QALYs compared to combinations
7 (Table 23).

8 **Table 23 - Results of base case analysis - Combination vs. Alpha-blockers**

	Mean cost (£)	QALYs	Incremental cost (£) per QALY gained	Sensitivity analysis
Alpha-blockers	3,824	12.4347	-	One-way SA: Combination is cost-effective if probability of adverse events with AB > 29% (16% in base case). Results were not sensitive to other changes in parameters or structure.
Combination	6,411	12.4276	Dominated	

9

10 In a set of one-way sensitivity analyses, where the low and high values were
11 respectively half or double the base case value, we identified the parameters
12 that might have changed the results. The only variable to which the model was
13 sensitive was the probability of adverse events with AB. We explored this
14 uncertainty further through a two-way SA where the probability of adverse
15 events with AB was co-varied with the probability of adverse events with
16 combination (Figure 243).

1

2 **Figure 243 - Two-way SA on probability of adverse events with AB (x axis) and comb (y**
 3 **axis). The area in green is where AB is cost-effective, while the area in blue is where**
 4 **combination is cost-effective. The black dot represents the base case values.**

5

6 If we consider a 95% confidence interval the base case results did not reach
 7 statistical significance (Table 24).

8 **Table 24 - Results of probabilistic SA - Comb vs. AB**

Mean ICER (£/QALY)	95% CI – lower limit (£/QALY)	95% CI – upper limit (£/QALY)	Probability of being cost-effective at £20,000/QALY
Comb dominated	3,850	Comb dominated	AB 90% Comb 10%

9

10 However, at a willingness to pay of £20,000/QALY alpha-blockers have a 90%
 11 probability of being cost-effective (Figure 244).

1
2 **Figure 244 - Acceptability curve of AB and Comb**
3

4 **10.4.10 Discussion**

5 5-ARI and AB have a different mechanism of action and the combination of the
6 two could enhance the effectiveness on men with LUTS. Our review of clinical
7 evidence (Chapter 6.10.1) has shown that the long-term (one year) improvement
8 in IPSS is higher with combinations than with AB. However there are extra costs
9 associated with the improvement and more side effects. The results of our model
10 show that after weighting the advantages (improvement in IPSS) and
11 disadvantages (costs and side effects) combinations are not cost-effective in a
12 general population of men with LUTS.

13 We based our model on studies where men had a normal prostate size. We
14 have deliberately excluded those studies conducted on men with large prostates
15 as 5-ARI are believed to be more effective in this group of men. A specific
16 model for that population could be built once good data are available.

17 We encountered some challenges when building our model: defining success of
18 treatment according to an IPSS improvement by 3 points might have been
19 arbitrary even if based on a previous study²⁴; however, when we changed this
20 definition to up to 10 points the overall results did not change.

21 Other assumptions were made while building the model but those did not have
22 an impact on the conclusions.

23 Adverse events were a core component of the model and their incidence was the
24 only parameter to which the results were sensitive. When we changed the
25 probability of adverse events with AB and combinations simultaneously we noted
26 that if the probability was lower with combination than with AB the former would
27 have been more cost-effective than the latter. Nevertheless, as AB are part of
28 the combination it would be very unlikely that their adverse events while used in
29 combination would be less frequent than when they are used alone.

1 This is the only model which compares AB and combination using randomized
2 data. A cost-utility analysis by McDonald et al (2004)¹⁹² concluded that
3 combinations were more cost-effective than Doxazosin but the clinical data were
4 obtained from men with large prostate for one arm and men with normal
5 prostate for the other arm. This explains the higher value-for-money of
6 combination in this study compared to ours. Conversely the cost-utility analysis by
7 DiSantostefano et al (2006)⁷¹ reached our same conclusions, yet the
8 effectiveness data on combinations were not based on RCTs but on assumptions.

9 **10.4.11 Conclusions**

- 10 • Combination of alpha-blockers with 5-ARI was not cost-effective in a
11 general population of men with LUTS.
- 12 • Clinical data on men with large prostate might be useful to assess the
13 cost-effectiveness in this group where combinations are presumed to be
14 more effective.

Appendix G - Recommendations for research

10.1 *Multichannel cystometry*

<p><u>PICO question</u> Each research recommendation should be formulated as an answerable question or a set of closely related questions. This should use the <u>PICO framework</u> (patient, intervention, comparison and outcome).</p>	<p>Question: What is the clinical and cost effectiveness of multichannel cystometry in improving patient related outcomes in men being considered for bladder outlet surgery? Patients: Bothering LUTS not responding to conservative therapy (catheterised patients excluded). Intervention: Pressure flow studies. Comparison: Two groups, awaiting bladder outlet surgery, randomised either to pre-operative pressure flow studies, or not Outcome: Primary outcome-patient-related outcome (IPSS, EQ5D), secondary outcomes-adverse events, flow rate, residual urine, pdetQmax.</p>
<p><u>Importance to patients or the population.</u> What would be the impact of any new or altered guidance on the population? (for example, acceptability to patients, quality of life, morbidity or disease prevalence, severity of disease or mortality).</p>	<p>This research would clarify whether this test could improve the outcome of surgery. If the result is positive, this could improve the chance of a good outcome from surgery.</p>
<p><u>Relevance to NICE guidance</u> How would the answer to this question change future NICE guidance (that is, generate new knowledge and/or evidence)?</p>	<p>As above, it would add to knowledge about the utility of pressure flow studies and allow them to be recommended or not recommended in future revisions of guidance.</p>
<p><u>Relevance to the NHS</u> What would be the impact on the NHS and (where relevant) the public sector of any new or altered guidance (for example, financial advantage, effect on staff, impact on strategic planning or service delivery)?</p>	<p>It would allow the NHS to know whether resources should be committed to the test or not.</p>
<p><u>National priorities</u> Is the question relevant to a national priority area (such as a national service framework or white paper)? The relevant document should be specified.</p>	<p>NSF for older people, Integrated Continence Services.</p>
<p><u>Current evidence base</u> What is the current evidence base? What are the problems with the current evidence</p>	<p>There are currently no randomised controlled trials comparing multichannel cystometry to no intervention in men</p>

<p>base? (that is, why is further research required?) Reference should be made to the section of the full guideline that describes the current evidence base, including details of trials and systematic reviews. The date on which the final literature search was undertaken should be specified.</p>	<p>before surgery.</p>
<p><u>Equality</u> Does the research recommendation address equality issues? For example, does it focus on groups that need special consideration, or focus on an intervention that is not available for use by people with certain disabilities?</p>	<p>No specific consideration.</p>
<p><u>Study design</u> It should also specify the most appropriate study design to address the proposed question(s). Primary research or secondary research (for example, systematic reviews) can be recommended.</p>	<p><i>Design:</i> A randomised comparative trial of men awaiting bladder outlet surgery, to be randomised to either a pressure flow study or not, before their surgery. The results of the pressure flow study would be used in subsequent counselling of patients in a protocol-driven way, before the proposed surgery, and <i>might</i> result in surgery not being done.</p> <p><i>Outcome:</i> As above.</p>
<p><u>Feasibility</u> Can the proposed research be carried out in a realistic timescale and at an acceptable cost? As part of cost-effectiveness analysis, formal value-of-information methods may also sometimes be used to estimate the value for money of additional research. Are there any ethical or technical issues?</p>	<p>The research would be ethically and technically feasible.</p>
<p><u>Other comments</u> Any other important issues should be mentioned, such as potential funders or outcomes of previous attempts to address this issue or methodological problems. However, this is not a research protocol.</p>	<p>The National Institute for Health Research (NIHR) would be an appropriate funding source. The normal service delivery cost to participants would be taken over by the research during the trial, thus relieving the service delivery budget. Since the NIHR is an NHS funded body the costs of care would simply be shifted from one NHS budget to another. Additional costs would be those associated with conducting the research itself.</p>
<p><u>Importance</u> How important is the question to the overall guideline? The research</p>	<p>High. The research is essential to inform future updates of key recommendations in the guideline.</p>

recommendation should be categorised into one of the following categories of importance:

- High: the research is essential to inform future updates of key recommendations in the guideline
- Medium: the research is relevant to the recommendations in the guideline, but the research recommendations are not key to future updates
- Low: the research is of interest and will fill existing evidence gaps.

10.2 Catheterisation

<p><u>PICO question</u> Each research recommendation should be formulated as an answerable question or a set of closely related questions. This should use the <u>PICO framework</u> (patient, intervention, comparison and outcome)</p>	<p>What are the clinical and cost effectiveness and associated adverse events of intermittent catheterisation compared to indwelling suprapubic or urethral catheterisation for men with voiding difficulty and chronic retention of urine?</p>
<p><u>Importance to patients or the population.</u> What would be the impact of any new or altered guidance on the population? (for example, acceptability to patients, quality of life, morbidity or disease prevalence, severity of disease or mortality).</p>	<p>The number of men judged unfit to undergo de-obstructing surgery is steadily increasing given the increasing proportion of older men in the population. Current practice varies widely across the UK with no established standard for long term management and no systematic review of practice. The research could establish the best approach to management in these men in the longer term and so bring more effective treatment, better focused on each patient's need, and consequent cost-efficiency gains.</p>
<p><u>Relevance to NICE guidance</u> How would the answer to this question change future NICE guidance (that is, generate new knowledge and/or evidence)?</p>	<p>NICE currently cannot give clear guidance on this topic because of an inadequate evidence base.</p>
<p><u>Relevance to the NHS</u> What would be the impact on the NHS and (where relevant) the public sector of any new or altered guidance (for example, financial advantage, effect on staff, impact on strategic planning or service delivery)?</p>	<p>Catheters are currently used variably across the UK with no systematic approach to management except for men with spinal cord injury. The aim of catheterisation, to drain the bladder so as to protect the upper renal tracts and maintain continence may not be achieved acceptably. Evidence-based guidance on the selection of the most suitable mode of catheterisation will benefit the quality of life of patients, ensure the efficient use of skilled staff and may reduce the costs of waste of unsuitable or sub-optimal product use.</p>
<p><u>National priorities</u> Is the question relevant to a national priority area (such as a national service framework or white paper)? The relevant document should be specified.</p>	<p>None currently relevant.</p>
<p><u>Current evidence base</u> What is the current evidence base? What</p>	<p>There is no currently no evidence for these interventions.</p>

<p>are the problems with the current evidence base? (that is, why is further research required?) Reference should be made to the section of the full guideline that describes the current evidence base, including details of trials and systematic reviews. The date on which the final literature search was undertaken should be specified.</p>	
<p><u>Equality</u> Does the research recommendation address equality issues? For example, does it focus on groups that need special consideration, or focus on an intervention that is not available for use by people with certain disabilities?</p>	<p>This treatment predominantly affects older people.</p>
<p><u>Study design</u> It should also specify the most appropriate study design to address the proposed question(s). Primary research or secondary research (for example, systematic reviews) can be recommended.</p>	<p>A randomised controlled study of the interventions:</p> <ul style="list-style-type: none"> a) intermittent catheterisation b) indwelling suprapubic catheterisation c) indwelling urethral catheterisation <p>Outcomes of interest: quality of life, healthcare resource utilisation, adverse events (including leakage, skin breakdown, infection, erosion and death).</p>
<p><u>Feasibility</u> Can the proposed research be carried out in a realistic timescale and at an acceptable cost? As part of cost-effectiveness analysis, formal value-of-information methods may also sometimes be used to estimate the value for money of additional research. Are there any ethical or technical issues?</p>	<p>The major issues with this trial would be the identification of cases and the studying of them in a primary care environment.</p> <p>An adequate population of men with this problem already exists precisely because of the absence of any consensus strategy for this group.</p>
<p><u>Other comments</u> Any other important issues should be mentioned, such as potential funders or outcomes of previous attempts to address this issue or methodological problems. However, this is not a research protocol.</p>	<p>None.</p>

Importance

How important is the question to the overall guideline? The research recommendation should be categorised into one of the following categories of importance:

- High: the research is essential to inform future updates of key recommendations in the guideline
- Medium: the research is relevant to the recommendations in the guideline, but the research recommendations are not key to future updates
- Low: the research is of interest and will fill existing evidence gaps.

High. Surgery is indicated as therapy for retention – but may not be appropriate in the presence of impaired bladder function (underactive) or where comorbidity precludes it.

10.3 Products for men with urinary incontinence

<p><u>PICO question</u> Each research recommendation should be formulated as an answerable question or a set of closely related questions. This should use the <u>PICO framework</u> (patient, intervention, comparison and outcome)</p>	<p>What is the clinical and cost effectiveness and associated adverse events of absorbent pads compared to sheath collectors for men with urinary incontinence?</p>
<p><u>Importance to patients or the population.</u> What would be the impact of any new or altered guidance on the population? (for example, acceptability to patients, quality of life, morbidity or disease prevalence, severity of disease or mortality).</p>	<p>The number of patients in this group is steadily increasing with more radical prostatectomies and an ageing demographic. Current practise varies widely across the UK with no established standards of good practice. The research could establish the best approach to continence management in these men and so bring more effective treatment, better focussed on each patient's needs, and consequently cost-efficiency gains.</p>
<p><u>Relevance to NICE guidance</u> How would the answer to this question change future NICE guidance (that is, generate new knowledge and/or evidence)?</p>	<p>NICE currently cannot give clear guidance on this topic because of an inadequate evidence base.</p>
<p><u>Relevance to the NHS</u> What would be the impact on the NHS and (where relevant) the public sector of any new or altered guidance (for example, financial advantage, effect on staff, impact on strategic planning or service delivery)?</p>	<p>Containment products are currently used variably across the UK. It is rare that any element of bladder training or recognition and treatment of bladder dysfunction is recognised as part of the continence management problem. The aim, so often, is simply to keep the patient socially dry; and even that is not always achieved acceptably. Evidence-based guidance on the selection of the most suitable containment product and its subsequent management will benefit the quality of life of patients, use skilled nurse/career resources more efficiently and reduce the costs of waste of unsuitable or sub-optimal product use.</p>
<p><u>National priorities</u> Is the question relevant to a national priority area (such as a national service framework or white paper)? The relevant document should be specified.</p>	<p>There is currently no national service framework for men with LUTS and incontinence or difficulty with bladder emptying.</p>
<p><u>Current evidence base</u> What is the current evidence base? What are the problems with the current</p>	<p>There is no currently no level 1 evidence for pads and sheaths.</p>

<p>evidence base? (that is, why is further research required?) Reference should be made to the section of the full guideline that describes the current evidence base, including details of trials and systematic reviews. The date on which the final literature search was undertaken should be specified.</p>	
<p><u>Equality</u> Does the research recommendation address equality issues? For example, does it focus on groups that need special consideration, or focus on an intervention that is not available for use by people with certain disabilities?</p>	<p>There are no equality issues.</p>
<p><u>Study design</u> It should also specify the most appropriate study design to address the proposed question(s). Primary research or secondary research (for example, systematic reviews) can be recommended.</p>	<p>A randomised controlled trial to compare these interventions. Outcomes of interest would be symptom severity, quality of life, changes in measured leakage, and occurrence of adverse events.</p>
<p><u>Feasibility</u> Can the proposed research be carried out in a realistic timescale and at an acceptable cost? As part of cost-effectiveness analysis, formal value-of-information methods may also sometimes be used to estimate the value for money of additional research. Are there any ethical or technical issues?</p>	<p>The major issues with this trial would be the identification of cases and the studying of them in a primary care environment.</p> <p>An adequate population of men with this problem already exists precisely because of the absence of any consensus strategy for this group.</p>
<p><u>Other comments</u> Any other important issues should be mentioned, such as potential funders or outcomes of previous attempts to address this issue or methodological problems. However, this is not a research protocol.</p>	<p>In general, manufacturers have been reluctant to fund randomised controlled trials. Currently the D4D project is addressing unmet needs. Work with specialist and patient advocacy groups and manufacturers will be essential.</p>
<p><u>Importance</u> How important is the question to the overall guideline? The research recommendation should be categorised into one of the following categories of importance:</p> <ul style="list-style-type: none"> • High: the research is essential to inform future updates of key recommendations in the guideline • Medium: the research is relevant to the recommendations in the guideline, but the 	<p>High. This is a population of men who have been rendered incontinent by surgery. The impact on their quality of life is profound and there is currently only one realistic treatment option for more major incontinence namely surgery which many men find unacceptable. It is important that solutions are found for this growing number of men.</p>

research recommendations are not key to future updates

- Low: the research is of interest and will fill existing evidence gaps.

10.4 Laser vapourisation techniques

<p><u>PICO question</u> Each research recommendation should be formulated as an answerable question or a set of closely related questions. This should use the <u>PICO framework</u> (patient, intervention, comparison and outcome)</p>	<p>What is the clinical and cost effectiveness and associated adverse events of laser vaporisation techniques compared to TURP in men with moderate to severe bothersome LUTS considering surgery for bladder outlet obstruction? Assessed by symptom severity, quality of life, and adverse events.</p>
<p><u>Importance to patients or the population.</u> What would be the impact of any new or altered guidance on the population? (for example, acceptability to patients, quality of life, morbidity or disease prevalence, severity of disease or mortality).</p>	<p>The potential advantages of reduced blood loss, shorter hospital stay and earlier return to normal activities make laser vaporisation techniques attractive to patients and healthcare providers although there is uncertainty around degree of symptom improvement and improvement in quality of life in the short and longer term.</p>
<p><u>Relevance to NICE guidance</u> How would the answer to this question change future NICE guidance (that is, generate new knowledge and/or evidence)?</p>	<p>NICE cannot give clear guidance on this intervention because the evidence base is inadequate. The proposed research will add new knowledge.</p>
<p><u>Relevance to the NHS</u> What would be the impact on the NHS and (where relevant) the public sector of any new or altered guidance (for example, financial advantage, effect on staff, impact on strategic planning or service delivery)?</p>	<p>Green Light laser use in the NHS is increasing at a rapid rate with approximately 70 units in the UK using it (~ 60% NHS and ~ 40% private sector) from personal communication with representatives of American Medical Systems Inc and clinical units. This is despite a lack of clinical and cost-effectiveness data to support this practice.</p>
<p><u>National priorities</u> Is the question relevant to a national priority area (such as a national service framework or white paper)? The relevant document should be specified.</p>	<p>None</p>
<p><u>Current evidence base</u> What is the current evidence base? What are the problems with the current evidence base? (that is, why is further research required?) Reference should be made to the section of the full guideline that describes the current evidence base, including details of trials and systematic reviews. The date on which the final literature search was undertaken should be specified.</p>	<p>A recent NCCHTA commissioned systematic review suggests that TURP should remain the standard of care and specifically that green Light Laser was unlikely to be cost-effective in the economic model and thereby arguing against its unrestricted use in the NHS until further evidence of effectiveness and cost-reduction is obtained ^{19,172-174}.</p>
<p><u>Equality</u> Does the research recommendation address equality issues? For example, does it focus</p>	<p>Not applicable</p>

<p>on groups that need special consideration, or focus on an intervention that is not available for use by people with certain disabilities?</p>	
<p><u>Study design</u> It should also specify the most appropriate study design to address the proposed question(s). Primary research or secondary research (for example, systematic reviews) can be recommended.</p>	<p>Primary research (RCT). Comparator is TURP. Careful consideration must be given to treatment strategies within the trial design such as incorporating early versus delayed intervention.</p>
<p><u>Feasibility</u> Can the proposed research be carried out in a realistic timescale and at an acceptable cost? As part of cost-effectiveness analysis, formal value-of-information methods may also sometimes be used to estimate the value for money of additional research. Are there any ethical or technical issues?</p>	<p>Proposed research can be carried out in a realistic timescale and at an acceptable cost. There are no ethical issues. A potential risk is that KTP laser vaporisation use may diminish without adequate assessment.</p>
<p><u>Other comments</u> Any other important issues should be mentioned, such as potential funders or outcomes of previous attempts to address this issue or methodological problems. However, this is not a research protocol.</p>	<p>NCCHTA would be the obvious funder</p>
<p><u>Importance</u> How important is the question to the overall guideline? The research recommendation should be categorised into one of the following categories of importance:</p> <ul style="list-style-type: none"> • High: the research is essential to inform future updates of key recommendations in the guideline • Medium: the research is relevant to the recommendations in the guideline, but the research recommendations are not key to future updates • Low: the research is of interest and will fill existing evidence gaps. 	<p>High</p>

10.5 Male slings

<p><u>PICO question</u> Each research recommendation should be formulated as an answerable question or a set of closely related questions. This should use the <u>PICO framework</u> (patient, intervention, comparison and outcome)</p>	<p>In men with mild to moderate post prostatectomy urinary incontinence (P), what is the clinical or cost effectiveness of a male sling or an extraurethral non circumferential compression device (IC), when assessed by symptom severity, quality of life, changes in measured leakage, and occurrence of adverse events (O).</p> <p>Possible interventions include: Non compression retrobulbar sling, compressive bulbar slings, adjustable bulbar slings, extraurethral compressive support and extraurethral non circumferential compression devices.</p> <p>Paraurethral injections have been used but are not recommended by the recent WHO International Consultation on Incontinence.</p>
<p><u>Importance to patients or the population.</u> What would be the impact of any new or altered guidance on the population? (for example, acceptability to patients, quality of life, morbidity or disease prevalence, severity of disease or mortality).</p>	<p>This increasingly prevalent group of men have, until recently, had no acceptable treatment option other than insertion of an artificial urinary sphincter but many men consider this treatment to be too invasive and too prone to complication or failure. A number of new interventions have been devised but there is no clarity on which of these offers the best outcomes. This research could lead to clear recommendations and effective treatment for the majority of these men.</p>
<p><u>Relevance to NICE guidance</u> How would the answer to this question change future NICE guidance (that is, generate new knowledge and/or evidence)?</p>	<p>NICE currently cannot give clear guidance on this topic because of an inadequate evidence base.</p>
<p><u>Relevance to the NHS</u> What would be the impact on the NHS and (where relevant) the public sector of any new or altered guidance (for example, financial advantage, effect on staff, impact on strategic planning or service delivery)?</p>	<p>This group of men currently depend on containment alone for control of their incontinence – there are likely to be cost savings from effective incontinence treatment. Insertion of an artificial urinary sphincter, whilst of recognised efficacy, carries a significant cost. Guidance is needed on the most suitable surgical options for this group of men.</p>
<p><u>National priorities</u> Is the question relevant to a national priority</p>	<p>There is currently no national service framework for men with LUTS or</p>

<p>area (such as a national service framework or white paper)? The relevant document should be specified.</p>	<p>incontinence.</p>
<p><u>Current evidence base</u> What is the current evidence base? What are the problems with the current evidence base? (that is, why is further research required?) Reference should be made to the section of the full guideline that describes the current evidence base, including details of trials and systematic reviews. The date on which the final literature search was undertaken should be specified.</p>	<p>There is currently no level 1 evidence for these surgical interventions because they are relatively new and have not been subjected to randomised controlled trials.</p> <p>NICE Interventional Procedures Committee has reported on Male slings (mostly “Invance”) and non circumferential extraurethral compression devices.</p>
<p><u>Equality</u> Does the research recommendation address equality issues? For example, does it focus on groups that need special consideration, or focus on an intervention that is not available for use by people with certain disabilities?</p>	<p>There are no equality issues.</p>
<p><u>Study design</u> It should also specify the most appropriate study design to address the proposed question(s). Primary research or secondary research (for example, systematic reviews) can be recommended.</p>	<p>A randomised controlled trial comparing up to three current interventions; retrobulbar “non compressive” male sling (Advance) , adjustable compression sling (Argos), and extraurethral non circumferential compression device (Proact) is recommended.</p> <p>However other new devices are being introduced rapidly into the market place with little or no clinical data to underpin marketing.</p>
<p><u>Feasibility</u> Can the proposed research be carried out in a realistic timescale and at an acceptable cost? As part of cost-effectiveness analysis, formal value-of-information methods may also sometimes be used to estimate the value for money of additional research. Are there any ethical or technical issues?</p>	<p>The major issues with this trial would be the centralisation of cases into centres able to offer the surgery and the training of participating surgeons since the procedures proposed are still relatively new.</p> <p>An adequate population of men with this problem already exists precisely because of the absence of any really effective treatment for this group.</p>
<p><u>Other comments</u> Any other important issues should be mentioned, such as potential funders or outcomes of previous attempts to address this issue or methodological problems. However, this is not a research protocol.</p>	<p>In general, manufacturers have been reluctant to fund randomised controlled trials and prefer to sponsor the establishment of surgical registries. Whilst these facilitate the involvement of a greater number of surgeons and cases, the risk of bias is very high. It may be that independent registries are a better way to establish the associated risks of surgery because of the feasibility of including all patients, not just those eligible</p>

<p><u>Importance</u> How important is the question to the overall guideline? The research recommendation should be categorised into one of the following categories of importance:</p> <ul style="list-style-type: none">• High: the research is essential to inform future updates of key recommendations in the guideline• Medium: the research is relevant to the recommendations in the guideline, but the research recommendations are not key to future updates• Low: the research is of interest and will fill existing evidence gaps.	<p>for inclusion in an RCT.</p> <p>High. This is a population of men who have been rendered incontinent by surgery which may or may not cure their cancer. The impact on their quality of life is profound and there is currently only one realistic treatment option which many men find unacceptable. It is important that solutions are found for this growing number of men.</p>

5. Over the past week, how often has your urinary stream been weaker than usual?	0	1	2	3	4	5	
6. Over the past week, how often have you had to push or strain to begin urination?	0	1	2	3	4	5	
	None	1 time	2 times	3 times	4 times	5 or more times	
7. Over the past week, how many times, in general, did you get up to urinate from the time you went to bed at night until the time you got up in the morning?	0	1	2	3	4	5	
INTERNATIONAL-PROSTATE SYMPTOM SCORE (cont'd)							
QUALITY OF LIFE DUE TO URINARY SYMPTOMS							
Question	Delighted	Pleased	Mostly satisfied	Mixed - neither satisfied nor dissatisfied	Mostly dissatisfied	Unhappy	Terrible
1. If you were to spend the rest of your life with your urinary condition just the way it is now, how would you feel about that?	0	1	2	3	4	5	6
