S38	(s28 or s29 or s30 or s31 or s32 or s33 or s34) AND pd(20030101-20141231)	41°

The ProQuest platform would not combine s36, s37 s38 and kept giving an error message. Went into the results page for s36, s37 s38 separately and used "Select all". Then downloaded all items in the "selected items" list n=238.

Appendices for evidence review of TB Service Delivery

Database: CEA Registry

Host: <https://research.tufts-nemc.org/cear4/>

Data Parameters: none

Date Searched: 25 March 2014

Searcher: PL

QA: TH

Strategy:

Search for tuberculosis n=32

Search for TB n=60

Unable to do sophisticated searches so decided to manually look through all results.

No bulk download so only added to RefMan if post 2003, case study country, non-animals, in English and also relevant to scope.

Google searching

Website: Google via <http://www.google.co.uk/>

Date Searched: 17 March 2014

Supplementary methods

Reference harvesting - all of the references available on Web of Science were downloaded and then the full text was obtained and any further relevant references were also added

Citation searching - all of the citations available on Web of Science were downloaded

PubMed related item - if there were 1-100 references they were all downloaded if they were relevant to the scope. If there were 101 or more references they were sorted by relevance and then the first 100 were downloaded if they were relevant to the scope. Relevant to the scope meant TB or tuberculosis was in the title.

All three methods were conducted on 19 March 2014 using the following papers.

Adalat S, Paliwalla M, Novelli V et al. (2008) A survey of tuberculosis services in the UK. *Archives of Disease in Childhood* 93 (7): 575-577.

Balasegaram S, Grant R, Ormerod P (2008) A survey of tuberculosis clinic provision in England and Wales. *Public Health* 122 (6): 602.

Barrett JC, Dart S, Solamalai A et al. (2011) Tuberculosis outcome following pre-treatment assessment for directly observed or selfadministered therapy: Still room for improvement? *Thorax* 66: A89.

Belling R, McLaren S, Boudioni M (2012) Pan-London tuberculosis services: a service evaluation. *BMC Health Serv Res.* 12: 203.

Bothamley GH, Kruijshaar ME, Kunst H (2011) Tuberculosis in UK cities: workload and effectiveness of tuberculosis control programmes. *BMC Public Health*, 11: 896.

Cayla JA, Orcau A (2011) Control of tuberculosis in large cities in developed countries: an organizational problem. *BMC Med.* 9:127.

Craig GM, Booth H, Hall J et al. (Feb. 2008) Establishing a new service role in tuberculosis care: the tuberculosis link worker. *Journal of Advanced Nursing* 61 (4): 413-424.

de,Vries G, van Hest RA (2006) From contact investigation to tuberculosis screening of drug addicts and homeless persons in Rotterdam. *Eur J Public Health.* 16(2):133-6.

Flanagan NA (2004) Transitional health care for offenders being released from United States prisons. *Canadian Journal of Nursing Research* 36 (2): 39-59.

Frieden TR (2009) Lessons from tuberculosis control for public health. *Int J Tuberc Lung Dis.* 13(4):421-8.

Hemming S, Windish P, Hall J et al. (2010) Treating TB patients with no entitlement to social support-welcome to the social jungle. *Thorax* 65: A146.

Jensen M, Lau A, Langlois-Klassen D (2012) A population-based study of tuberculosis epidemiology and innovative service delivery in Canada. *Int J Tuberc Lung Dis,* 16(1): 43-9.

Jit M, Stagg HR, Aldridge RW (2011) Dedicated outreach service for hard to reach patients with tuberculosis in London: observational study and economic evaluation. *BMJ,* 343: d5376.

King R, Carter MJ, Mungall SB et al. (2009) Does a specialist TB nurse service improve outcome? *Thorax* 64: A121-A122

Millet JP, Shaw E Orcau A (2013) Tuberculosis recurrence after completion treatment in a European city: reinfection or relapse? *PLoS ONE.* 8(6): e64898.

Tsikoudas A (2003) Management pathways and the surgical diagnosis of tuberculous lymphadenitis: Can they be improved? *The Bradford experience.* *ORL* 65 (5): 261-265.

Post search supplementary methods

Following the initial screening a further round of supplementary searching was conducted. The papers that had been identified as potentially relevant for the review during the sifting stage were used for citation searching. All of the citations available on Web of Science were downloaded and then de-duplicated against what had already been screened. At least one paper was chosen for each of the case studies. Citation searching for effectiveness studies was conducted on 5 June 2014 and for cost effectiveness studies on 3 July 2014.

Appendices for evidence review of TB Service Delivery

Backx 2011

<p>Authors: Backx, M., Curtis, H., Freedman, A., & Johnson, M. Year: 2011 Citation: British HIV Association national audit on the management of patients co-infected with tuberculosis and HIV. Location: UK - National Aim of study: The objective was to compare current UK management of TB-HIV with national standards, including diagnostic delay and treatment completion. Study design: Audit Quality score: Not evaluated in CA External validity score: Not evaluated in CA</p>	
<p>Population and setting</p>	
<p>Source population UK services providing HIV care.</p> <p>Eligible population Services listed in the British HIV Association (BHIVA) database and were thought to provide adult HIV care.</p> <p>Selected population Services with case notes of HIV positive patients aged 16+ who started therapy for active TB during October 2007 – April 2008 and their corresponding TB services if separate.</p> <p>Excluded population Records of patients receiving chemoprophylaxis for LTBI. Records of patients where TB therapy commenced but subsequently stopped due to alternative diagnosis.</p>	<p>Population characteristics Men: 47%; Black African: 74.6%; from high TB prevalence countries: 84.7%; aged 30-50: 73.7%; aged 30 and younger: 13.6%; aged 50+: 9.8%; had advanced HIV disease: 69.1%; pulmonary TB: 40.7%; extra-pulmonary disease: 41.9%; pulmonary + extra-pulmonary disease: 17.4%; culture-confirmed TB: 57.6%; positive microscopy for acid-fast bacilli: 13.6%</p> <p>Setting Services offering adult HIV care.</p> <p>Location UK – National</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 124 HIV services and 18 corresponding TB services. Of the 124 HIV services, 105 were not fully integrated, and 19 were fully integrated providing care for TB, HIV and TB-HIV Intervention N= 236 HIV positive patients who started treatment for TB Comparator N= 236 HIV positive patients who started treatment for TB</p> <p>Baseline comparisons NA</p> <p>Power of study</p>	<p>Intervention Current (2007/8) management of TB-HIV co-infection in the UK.</p> <p>Comparator National standards.</p>

Appendices for evidence review of TB Service Delivery

NR	
Outcomes and methods of analysis	
<p>Outcomes TB treatment completion and culture confirmed pulmonary TB compared to national recommendations from the chief medical officer. Time to obtain sputum smear results compared to national standards from the Health Protection Agency. TB notification compared to Public Health Act 1913. Also assessed HIV testing of TB patients.</p> <p>Follow up period NA</p>	<p>Methods of analysis Demographics, including proportions.</p>
Service delivery results	
<p>DIAGNOSTIC DELAYS Time between sample taken and results received in 60 sputum smear positive cases: 45% (27/60): same or next day 16.7% (10/60): within 2-3 days 25% (15/60): 4+ days 13.3% (8/60): data unavailable</p> <p>National recommendation: positive results within 24 hours on six day/week service, and all results in writing within 72 hours.</p> <p>TREATMENT COMPLETION: Patient treatment status at time of audit: Treatment completed without interruption: 61% (144/236) Treatment ongoing: 21.6% (51/236) Therapy interrupted: 5.1% (12/236)</p> <p>Reasons for failure to complete treatment: Left UK: 4.7% (11/236) Transferred care within UK: 2.5% (6/236) Died before treatment completion: 2.5% (6/236) Lost to follow-up: 2.5% (6/236)</p> <p>Excluding patients still on therapy: 81.2% (147/181[#]): completed TB therapy 4.7% (11/181): left UK while on treatment 2.5% (6/181): transferred care within UK 2.5% (6/181): died before treatment completion 2.5% (6/181): lost to follow-up National recommendation: > 85% treatment completed.</p>	<p>Other results Proportion known TB Notifications Notification documented: 36.0% (85/236) Believed to be documented: 47.9% (113/236) Not notified: 2.5% (6/236) – 3/6 had sputum smear positive pulmonary TB Notification status known: 13.6% (32/236)</p> <p>Proportion patients with TB culture confirmation Culture-confirmed: 57.6% (136/236) Culture-confirmed pulmonary TB: 65.7% (90/137)</p> <p>Proportion services offering routine HIV testing: Integrated TB-HIV services: 68% (13/19) TB services: 56% (10/18)</p> <p>Proportion patients receiving HIV testing HIV diagnosis prior to TB investigation: 55.5% Diagnosed during TB investigation: 42%</p> <p>Attrition details 124/170 HIV services responded.</p>
Notes and other information	
<p>Author conclusions Excluding patients still on treatment, treatment completion rate was close to target (81% reached, 85% goal). Unacceptable diagnostic delays were observed as the majority of sputum smear positive cases were not reported within the recommended 24 hours. Many services do not routinely test TB patients for HIV.</p> <p>Author limitations There was a poor response rate from TB services not providing integrated TB-HIV care that was likely due to being</p>	<p>Limitation identified by review team A third of HIV services did not respond to the audit and TB services providing integrated TB-HIV care also had a poor response rate. It is unclear if the non-responders were different than the responders which could provide a biased picture of TB-HIV management in the UK.</p>

Appendices for evidence review of TB Service Delivery

indirectly recruited from HIV services. This limited information about their integrated work with HIV services.

Evidence gaps and/or recommendations for future research and policy

HIV and TB services should provide high quality co-ordinated services for diagnosis, treatment and continuing patient care. Clinicians, trusts and commissioners should work together to promote HIV testing in all healthcare settings and reduce the proportion of undiagnosed infection.

Source of funding

Department of Health

Numbers do not appear to add up; review team unable to account for this discrepancy.

Bothamley 2011

<p>Authors: Bothamley, G.H., Kruijshaar, M.E., Kunst, H., Woltmann, G., Cotton, M., Saralaya, D., Woodhead, M.A., Watson, J.P., & Chapman, A.L.N. Year: 2011 Citation: Tuberculosis in UK cities: workload and effectiveness of tuberculosis control programmes. BMC Public Health, 11:896 Location: Large cities within the UK Aim of study: The objective was to examine how the national plan for tuberculosis control had been incorporated into control programs in large UK cities. Study design: National evaluation Quality score: Not provided by CA External validity score: Not provided by CA</p>	
<p>Population and setting</p>	
<p>Source population Primary care trusts in the UK.</p> <p>Eligible population Primary care trusts associated with a TB service in the ten most populous urban areas in the UK (as defined by data from the 2001 census), with an average of 100 TB cases per year.</p> <p>Selected population Primary care trusts from London, Birmingham, Manchester, West Yorkshire, Glasgow, Newcastle, Liverpool, Nottingham, Sheffield, Edinburgh, Leicester, and Coventry for which data was available.</p> <p>Excluded population NR</p>	<p>Population characteristics: Population covered by TB clinic – Incidence per 100,000 London: 7,747,748 – 44.4 Birmingham: 2,284,093 – 22.3 Manchester: 419,628 – 59.1 West Yorkshire: 762,461 – 15.7 (Leeds) and 467,363 – 38.3 (Bradford) Glasgow: 866,379 – 24.2 Newcastle: 268,751 – 16.0 Liverpool: 433,333 – 12.0 Nottingham: 909,836 – 9.5 Sheffield: 530,000 – 20.0* Edinburgh: 452,514 – 17.9 Leicester: 304,598 – 69.6 Coventry: 312,925 – 29.4</p> <p>Setting Cities in the UK.</p> <p>Location UK – urban</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 12 Cities were identified Intervention N= NA Comparator N= NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Current management of TB in the respective city/PCT.</p> <p>Comparator Comparisons were made between the cities/PCTs and against the national TB action plan</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Fifteen items from the TB action plan, including, named key worker, DOT, target of 1 nurse for 40 TB cases, peer review against NICE guidelines. TB treatment completed within 12 months.</p> <p>Follow up period</p>	<p>Methods of analysis Trend line to calculate annual percentage changes. Chi-squared test. Spearman's rank correlation.</p>

Appendices for evidence review of TB Service Delivery

NA	
Service delivery results	
<p>Proportion TB treatment completed within 12 months (2006-2008): Birmingham East/North: 85.1% Heart of Birmingham Teaching: 83.1% Central Manchester: 83.5% Leeds: 80.9% Bradford and Airedale Teaching: 78.1% Sandwell: 76.8% Leicester City: 86.6% Sheffield: 75.8% London (reported as region, not PCT): 82.6%</p> <p>Proportion patients who had DOT at any point during treatment last year: Birmingham: 21% Bradford: 0% Glasgow: 0% Leeds: 3% Leicester: 5% London: 1.7% - 32% (access to DOT variable) Manchester: 2% Sheffield: 5-10%</p> <p>Target of 1 nurse per 40 cases: Birmingham: 1:60-70 Bradford: No specified TB nurses Glasgow: Not achieved Leeds: Achieved Leicester: Achieved London: Ranged from 1:21 – 1:51 Manchester: Not achieved Sheffield: Achieved</p>	<p>Other results Formal peer review against NICE guidelines: Birmingham: No Bradford: No Glasgow: No – Scottish guidelines awaiting agreement Leeds: Internal review Leicester: No – regular audits/epidemiological review London: Formal reviews in NE and NC London Manchester: Yes - annually Sheffield: Yes</p> <p>Named worker accountable for each TB patient: All reported as yes.</p> <p>Joint TB-HIV clinic: Birmingham: Yes Bradford: Run by infectious diseases (ID) physician Glasgow: No Leeds: Just starting Leicester: Yes between ID and genitourinary physicians London: All sectors have one or more Manchester: No, but weekly joint multidrug therapy Sheffield: Same physician</p> <p>Attrition details NA</p>
Notes and other information	
<p>Author conclusions TB control programmes require an adequate number of TB nurses (ratio of TB nurse to TB cases 1:40) in order to achieve early detection and effective case-holding, Good local epidemiology is important for forecasting the projected number of TB cases and resourcing appropriately.</p> <p>Author limitations London is a complex group of communities with several PCTs having a high burden of TB; as such, further detailed analysis is recommended.</p> <p>Evidence gaps and/or recommendations for future research and policy Costs for MDRTB need to be allocated through a national scheme of specialised commissioning, so as not to undermine general TB resourcing.</p> <p>Source of funding Homerton Respiratory Research and Education Fund.</p>	<p>Limitation identified by review team Obtaining data across cities was reported to be more difficult than expected, with some cities taking as long as 22 months to provide data. Data for Glasgow were reported to be affected by changes in boundaries, and data for Sheffield were flagged as being different between ETS and clinic.</p>

* Discrepancy found in reported incidence in Manchester and Sheffield (perhaps 40.5/100,000 and 14.6/100,000 respectively).

Cullen 2012

<p>Authors: Cullen, D., Watson, J.P., & Davies, P.D.O. Year: 2012 Citation: British Thoracic Society MDR-TB[#] Clinical Advice Service. Thorax, 67(Suppl 2), A89. Location: Online service developed in Liverpool, UK Aim of study: The aim was to assess whether an online TB service could increase dialogue between experts and TB service users for MDR-TB case management. Study design: National report Quality score: Not addressed by CA External validity score: Not addressed by CA</p>	
<p>Population and setting</p>	
<p>Source population Persons accessing an online TB service.</p> <p>Eligible population Persons accessing online TB service from July 2011.</p> <p>Selected population Persons accessing online TB service during a one year period starting from July 2011.</p> <p>Excluded population NR</p>	<p>Population characteristics (Intervention v Comparator) NR</p> <p>Setting Online TB service.</p> <p>Location Online service developed from an initiative in Liverpool in 2008.</p>

Notes and other information	
<p>Author conclusions The online TB service has increased case discussion and is regularly being followed by further requests for help.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy NR</p> <p>Source of funding NR</p>	<p>Limitation identified by review team The present study is an abstract and thus provides limited information on the intervention implemented and population demographics.</p> <p>The service is briefly described at the end of the abstract. However it is unclear whether this describes the service during the study period or whether the features have since been developed.</p>

MDR-TB: multidrug resistant tuberculosis

Panchal 2012

<p>Authors: Panchal, R.K., Woltmann, G., & Haldar, P. Year: 2012 Citation: Reduced Effectiveness of the Primary-Care Registry for Targeted LTBI Screening of High Risk Immigrants with HIV Co-Infection. (Abstract). Thorax:67(Suppl 2):A1-A204. doi:10.1136/thoraxjnl-2012-202678.192 Location: UK - National Aim of study: Objective was to investigate the effectiveness of the primary-care registry in identifying immigrants for enrolment to LTBI screening at time of GP registration. Study design: Retrospective cohort study Quality score: + External validity score: +</p>	
Population and setting	
<p>Source population Immigrants in the UK</p> <p>Eligible population Immigrants with available HIV status in the primary care registry.</p> <p>Selected population Primary care registrations for immigrants entering UK after 1999 who had HIV testing performed; these were cross-referenced with foreign-born TB notifications.</p> <p>Excluded population NR</p>	<p>Population characteristics (Intervention v Comparator) HIV positive cases occurring among immigrants from TB endemic countries (incidence < 500/100,000): 67% (56 / 84)</p> <p>Setting Primary care (GP)</p> <p>Location UK - National</p>
Methods of allocation to intervention/control	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N = 857 foreign-born TB cases in registry Intervention N= 857 Comparator N= NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Analysed effectiveness of using the primary care registry to target LTBI screening among immigrants.</p> <p>Comparator NA</p>
Outcomes and methods of analysis	
<p>Outcomes Proportion of preventable LTBI with screening at time of GP registration among immigrants with known HIV status.</p> <p>Follow up period NA</p>	<p>Methods of analysis Proportions. Risk ratios. Interquartile ratios (IQR).</p>
Service delivery results	
<p>Proportion immigrant TB cases preventable (if screened at GP registration): 63% (511 / 857)</p>	<p>Other results Proportion immigrant cases: HIV tested: 72.8% (624 / 857) HIV seropositive: 13.4% (84 / 857)</p>

Appendices for evidence review of TB Service Delivery

<p>Proportion HIV+ v HIV- for TB cases unpreventable: Significantly higher for HIV+ 19% v 10%; RR (95% CI) = 1.89 (1.25 – 2.84)</p> <p>Time to primary care registration: Significantly longer for HIV+ v HIV- immigrants Median IQR: 1515 (555-2202) days v 415 (36-1558) days; $p < 0.005$</p> <p>Time to disease notification: Significantly shorter for HIV+ v HIV- immigrants Median IQR: 587 (208-1182) days v 1163 (669-1854) days; $p < 0.005$</p>	<p>Attrition details NA</p>
Notes and other information	
<p>Author conclusions Targeted LTBI screening at time of primary care registration may be less effective among HIV+ immigrants.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy The authors recommended that early GP registration and extended screening to include HIV and other blood-borne viruses is needed as part of an integrated immigrant screening programme.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team As this article is an abstract, very little information is available to describe the selected population, study design, and merits or limitations of the research.</p>

Van Hest 2008

<p>Authors: Van Hest, N.A.H., Story, A., Grant, A.D., Antoine, D., Crofts, J.P., & Watson, J.M. Year: 2008 Citation: Record-linkage and capture-recapture analysis to estimate the incidence and completeness of reporting of tuberculosis in England 1999 – 2002. <i>Epidemiol. Infect.</i>: 136, 1606-1616. Location: England, UK Aim of study: The aims were to estimate the annual incidence of TB in England, and use record-linkage and capture-recapture analysis to assess the completeness of TB reporting during 1999–2002. Study design: Retrospective cohort design Quality score: + External validity score: +</p>	
<p>Population and setting</p>	
<p>Source population TB notifications in England.</p> <p>Eligible population TB notifications in the Enhanced Tuberculosis Surveillance (ETS) system.</p> <p>Selected population TB cases notified through ETS, cases with <i>M. tuberculosis</i> complex isolates reported to MycobNet Laboratory, and cases admitted to NHS hospitals with a first or secondary hospital discharge code of TB from 1 January 1999 – 31 December 2002.</p> <p>Excluded population Duplicate records. Records with incomplete or missing data for date of birth and age.</p>	<p>Population characteristics (Intervention v Comparator) NR</p> <p>Setting TB service</p> <p>Location England - National</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 28,678 observed TB cases Intervention N= 28,678 observed TB cases Comparator N= 6783 observed cases in 1999; 7139 cases in 2000; 7355 cases in 2001; 7401 cases in 2002</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Record-linkage and capture-recapture analysis was used to estimate the annual TB incidence in England and completeness of reporting TB via the ETS system from 1999-2002.</p> <p>Comparator Comparisons were made between years from when the service was introduced.</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Estimated unobserved number of TB cases annually. Estimated total number of TB cases annually. Proportion laboratory-confirmed, un-notified cases, under-notified. Proportion records complete.</p> <p>Follow up period NA</p>	<p>Methods of analysis Proportions. Population mixture model. Saturated log-linear capture-recapture model. Zelterman's truncated Poisson mixture model.</p>
<p>Service delivery results</p>	
<p>Proportion cases observed, laboratory-confirmed, but un-notified: 10.4%</p>	<p>Other results Estimated unobserved number of TB cases from Poisson mixture model (95% approximate confidence</p>

Appendices for evidence review of TB Service Delivery

<p>Proportion cases observed and under-notified: 15.9%</p> <p>Proportion records complete: 1999: 78.2% 2000: 74.1% 2001: 81.0% 2002: 83.8%</p>	<p>interval [ACI]: 1999: 1319 (1137-1509) 2002: 917 (748-1093) All (4 years; 1999 – 2002): 5417 (5217-5737)</p> <p>Estimated total number of TB cases from Poisson mixture model (95% ACI): 1999: 8102 (7920-8292) 2002: 8398 (8229-8574) All: 34,149 (33,895-34,415)</p> <p>Attrition details NA</p>
<p>Notes and other information</p>	
<p>Author conclusions Record-linkage improves accuracy of TB surveillance data and completeness of ascertained TB records, as performed in ETS.</p> <p>Author limitations Assumptions of homogeneity not met for statistical analyses. Misclassification of records would have interfered with record-linkage. Hospital TB cases provided disproportionately high number of false positive TB cases. Innate limitations of capture-recapture methods.</p> <p>Evidence gaps and/or recommendations for future research and policy To further increase notifications a clinician (such as a chest physician) should be appointed as a TB co-ordinator in every hospital, and be consulted on every TB patient in that hospital, including extra-pulmonary.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team No limitations identified by review team.</p>

UK London (9 studies)

Aldridge 2014

<p>Authors: Aldridge R, Yates S, Hemming S et al. Year: 2014 Citation: IMPACT OF PEER EDUCATORS ON UPTAKE OF MOBILE X-RAY TUBERCULOSIS SCREENING AT HOMELESS HOSTELS: A CLUSTER RANDOMISED CONTROLLED TRIAL. Thorax 69(S2) Location: London, UK Aim of study: To compare current practice of hostel staff encouraging mobile digital X-ray unit (MXU) screening for TB among homeless people with the addition of peer educators with direct experience of TB and/or homelessness on screening uptake. Study design: Cluster RCT Quality score: + External validity score: ++</p>	
Population and setting	
<p>Source population Hostels in London</p> <p>Eligible population Hostels in London that met inclusion criteria</p> <p>Selected population Residents in hostels in London that were not on active TB treatment and had not had a chest x-ray within last 6 months.</p> <p>Excluded population Hostels excluded for various reasons, including high uptake rates, or didn't allow peers access to residents.</p>	<p>Population characteristics (Intervention v Comparator) Hostel sites with >50% uptake (12 v 15); hostels with <43 beds (12 v 13).</p> <p>Setting Hostels</p> <p>Location Urban – London</p>
Methods of allocation to intervention/control	
<p>Method of allocation Cluster randomised 46 of 59 hostels by minimisation, balancing on hostel size (≤43 beds), and previous screening uptake level (≤50%). Sites with a previous MXU uptake of >80% were excluded.</p> <p>Method to minimise confounding Poisson regression adjusted for size of hostel and previous screening uptake. Blinding was not possible.</p> <p>Recruitment strategy Recruited : Feb 2012 to October 2013</p> <p>Sample sizes: Total sample N=46 hostels Intervention N=22 hostels (1150 eligible residents) Comparator N=24 hostels (1192 eligible residents)</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Hostel staff encouraging MXU screening with the addition of peer educators with direct experience of TB and/or homelessness on screening uptake. Peers encouraged screening by speaking and contacting residents.</p> <p>Comparator Current practice of hostel staff encouraging MXU screening.</p>
Outcomes and methods of analysis	
<p>Outcomes Uptake in screening</p> <p>Follow up period NR</p>	<p>Methods of analysis An ITT analysis was undertaken on the proportion of eligible residents screened for TB, with interquartile ranges. Poisson regression was used to account for cluster design.</p>
Service delivery results	
<p>Screening uptake (diagnostic delay) Poisson regression: RR 0.98% (95% CI 0.80 to 1.20)</p>	<p>Screening rate Overall: 44% uptake (IQR 26,59) Intervention: 45% uptake (IQR 33,55)</p>

Appendices for evidence review of TB Service Delivery

	Control: 40% (IQR 25,61)
Notes and other information	
<p>Author conclusions There was no evidence for peer educators increasing the uptake of MXU TB screening.</p> <p>Author limitations The lack of effect could be explained by a pragmatic study design where sites were not naïve to the intervention as peers had previously been involved in screening sessions at many hostels.</p> <p>Evidence gaps and/or recommendations for future research and policy NR</p> <p>Source of funding NIHR Programme Grant for Applied Research (RP-PG-0407–10340).</p>	<p>Limitation identified by review team Limited information from abstract. However, the authors noted that results were likely confounded by hostel sites in non-peer group being previously exposed to peers, which may have underestimated the effect of peers.</p>

Anderson 2014

<p>Authors: Anderson, C., White, J., Abubakar, I., Lipman, M., Tamne, S., et al# Year: 2014 (online 2013) Citation: Raising standards in UK TB control: introducing cohort review. Thorax, 69 (2) 187 - 189 Location: London, UK Aim of study: To evaluate the effect of cohort review in a north London TB service. Study design: Before and after study Quality score: + External validity score: ++</p>	
<p>Population and setting</p>	
<p>Source population Persons with TB in London, UK.</p> <p>Eligible population Persons with TB receiving care at North Central London (NCL) TB Service.</p> <p>Selected population All patients notified as having TB disease by the five NCL TB clinics.</p> <p>Excluded population Cases notified during this time which were later found not to have TB.</p>	<p>Population characteristics (Intervention v Comparator) Male: 54% v 44%; aged 20-39 years: 48.5% v 44.5%; non-UK born: 79% v 75.6%; recent migrant: 14.8% v 10.4% (p=0.038); long-term resident: 46% v 57.2% (p<0.001).</p> <p>Setting NCL TB Service.</p> <p>Location London, UK</p>

Griffiths 2007

<p>Authors: Griffiths, C., Sturdy, P., Brewin, P., Bothamley, G., et al. Year: 2007 Citation: Educational outreach to promote screening for tuberculosis in primary care: a cluster randomised controlled trial. The Lancet, 369(9572), 1528-34. Location: London, UK Aim of study: The trial was undertaken to evaluate the effectiveness of a TB screening programme in a London Primary Care Trust (PCT) which screened patients at time of PCT registration. Study design: Pragmatic cluster randomised controlled trial Quality score: ++ External validity score: ++</p>	
<p>Population and setting</p>	
<p>Source population Persons in London.</p> <p>Eligible population Persons registering as new patients at general practices in the City and Hackney Teaching Primary Care Trust (PCT).</p> <p>Selected population Persons registered with the participating general practices during 1 June, 2002 – 1 October, 2004.</p> <p>Excluded population Three PCTs in Hackney were not included in the cluster randomisation – one was ineligible as it was used as a pilot practice for the present study and two declined to participate.</p> <p>Patients were excluded if de-notified.</p>	<p>Population characteristics (Intervention v Comparator) Median number new patients per practice: 1,546 v 1,573; mean age: 29 v 26; male: 47% (21,143/44,986) v 46% (22,533/48,984); white: 45% (20,244/44,986) v 42% (20,573); black: 22% (9,897/44,986) v 24% (11,756/48,984); south Asian: 9% (4,049/44,986) v 10% (4,898/48,984); mean number new immigrant patients per practice: 248 v 272.</p> <p>Setting General practice. Location Hackney, London, UK</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation General practices were randomised to intervention and comparator groups with a computer minimisation program (Minim Version 1.3).</p> <p>Method to minimise confounding Minimisation criteria for randomisation included the number of partners in the general practice, employment of practice nurse, approval for training of general practitioners, use of EMIS practice computer system, whether surgery registered new patients, rate of registration checks in new patients, and participation in local scheme to promote registration of asylum seekers.</p> <p>The definition of a TB case was specified at the start of the study and applied independently to participants' medical records by two researchers blinded to practice allocation with arbitration of any differences by a third researcher who was blinded to allocation.</p> <p>Identification route, clinical data, and patient demographics were entered blind into the study database.</p> <p>Recruitment strategy To achieve maximum power the researchers aimed to recruit for 25 months.</p> <p>Sample sizes: Total sample N= 93,970 new patients; 46,624 attended registration health check Intervention N= 44,968 new patients; 23,573 attended registration health check Comparator N= 48,984 new patients; 23,051 attended registration health check</p>	<p>Intervention Patients at the general practices randomised to the intervention group received TB screening at their PCT registration health check. The intervention entailed a specialist TB nurse and academic GP making an educational outreach visit to each intervention practice to promote TB screening and raise TB awareness. They distributed screening guidelines. Prompts were included into the practice computer system for registration health checks to remind clinicians to ask the screening questions. Equipment for TST was provided. Telephone support from a specialist TB nurse was available. A financial incentive of £7 was paid to the practice for each TST administered.</p> <p>Comparator Patients at general practices randomised to the control group received usual care. These general practices received no contact. Some practices in the control group had already been administering TST and continued to do so.</p>

Appendices for evidence review of TB Service Delivery

<p>Baseline comparisons In the year prior to the study period, 150 active TB cases were identified in Hackney, of which 55% (83/150) were referred by or diagnosed in general practice. This detection rate was assumed to be the same for the control group.</p> <p>Power of study To detect a clinically significant increase of 20% (thus an increase in diagnosis rate from 55% at baseline to 75%) with 80% power at the 5% significance level, a total of 280 active TB cases were needed during the study period.</p>	
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Proportion new cases of active TB identified (primary outcome). Proportion new cases of latent TB identified. Persons aged 5 and older receiving BCG immunisation. Percentage new registrations screened for TB. Numbers of TST undertaken.</p> <p>Follow up period NR</p>	<p>Methods of analysis Intention-to-treat analyses using generalised estimation equations with a logit link to account for clustering were used to calculate Tb cases. Poisson regression was used for tubulin skin tests and BCG coverage.</p>
<p>Service delivery results (intervention v comparator)</p>	
<p>Proportion new patients attending registration health check 52% (23,573/44,986) v 47% (23,051/48,984)</p> <p>Proportion patients screened for TB at registration health check: 57% (13,478/23,573) v 0.4% (84/23,051)</p> <p>TST undertaken 8.5% (1996/23,573) v 0.4% (84/23,051)</p> <p>BCG coverage Rate: 26.8 per 1000 v 3.8 per 1000 Rate ratio: 9.52 (95% CI 4.0 – 22.7; $p < 0.001$)</p>	<p>Active TB Diagnosis 47% (66/141) v 34% (54/157) OR: 1.68 (95% CI 1.05 – 2.68; $p = 0.03$)</p> <p>Latent TB Diagnosis 19% (11/58) v 9% (5/68) OR: 3.00 (95% CI 0.98 – 9.20; $p = 0.055$)</p> <p>Attrition details None, as all practices in cluster randomisation were included in analyses.</p>
<p>Notes and other information</p>	
<p>Author conclusions The educational outreach intervention promoting TB screening and health registration checks improved diagnosis of active and latent TB, thus improving active case finding. It also increased BCG coverage almost seven times. Screening identified more than a third of the extra active TB cases diagnosed in primary care. The authors also suggest the intervention was mediated by promotion of screening and raising clinicians' awareness of TB.</p> <p>Author limitations The study was limited in that they were able to measure the proportion of cases identified rather than changes in identification rate. This measurement would have required a much larger sample size.</p> <p>Evidence gaps and/or recommendations for future research and policy Future research should test more effective ways to detect latent TB, perhaps using serological immunodiagnostic tests. More evidence is also needed to show effectiveness and cost-effectiveness of screening method, site, and target population.</p> <p>Source of funding UK Department of Health, Primary Care Studies Programme and Ad Hoc Funding</p>	<p>Limitation identified by review team As noted by the researchers, participants and practitioners may have been aware of which group they were allocated to as it was not possible to blind them to the presence or lack of a new TB screening programme.</p>

Hall 2010

<p>Authors: Hall J, Bethell S, Hellern S et al. Year: 2010 Citation: Evaluation of TB Peer Educators – Essential Partners in Metropolitan TB Control. Thorax 65(4) Location: London, UK Aim of study: To improve service access and uptake of TB screening among hard-to-reach groups Study design: Before and after Quality score: - External validity score: +</p>	
Population and setting

Department of Health

Hayward, 2010

<p>Authors: Hayward, J., Murray, D., Iny, I., Jarrett, J., Lonergan, K., Pillas, D., & Seager, S. Year: 2010 Citation: London TB Service Review and Health Needs Assessment. Public Health Action Support Team (PHAST) Final Project Report. Location: London, UK Aim of study: Aim was to assess performance of five sector-wide clinical networks against local standards across London. Study design: Local report Quality score: Not addressed by CA External validity score: Not addressed by CA</p>	
<p>Population and setting</p>	
<p>Source population Persons with TB in London.</p> <p>Eligible population Persons with TB reporting to one of 30 TB services in London for care.</p> <p>Selected population 29 TB services in London were identified and sent survey questionnaire and were included in review. The services were in five sectors: North Central London, North East London, North West London, South East London, and South West London.</p> <p>Excluded population Queen Mary's Sidcup hospital no longer runs a TB service clinic (service provided by Greenwich), and so was not included in service review.</p>	<p>Population characteristics (proportion various groups account for TB cases reported by questionnaires) UK-born persons: 15%; black African: 28%; Indian: 27%; White: 17%; pulmonary TB: 49%; aged 15-44: 65%; <16 years old: 5%; alcohol use: 7%; mental health issues: 5%; drug use: 4%; homelessness: 3%; resistant to Isoniazid: 10%; multi-drug resistant: 2.2%</p> <p>These proportions are not uniform across all five sectors of London.</p> <p>Only one case was XDR-TB was reported; proportion not calculated.</p> <p>Setting TB service clinics around London providing outpatient and inpatient services in 2009.</p> <p>Location London, UK</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy 29 TB services around London were identified through the scoping process of the present review. No further detail provided on recruitment.</p> <p>Sample sizes: Total sample N= 29 TB services Intervention N= NA Comparator N= NA</p> <p>Baseline comparisons Some comparisons made for TB rate between years 2009 and previous years. Some comparisons made for financial expenditures between fiscal year 2010-2011 and year 2009-2010.</p> <p>Power of study NA</p>	<p>Intervention Current practice in the different TB services across London. A survey questionnaire was mailed to named contacts (usually lead TB nurse) at each clinic to gather detail on service use; all 29 services responded.</p> <p>Comparator NA</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Diagnostic delay (also referred to as "prompt diagnosis"). Treatment completion. Contact tracing. DOT use.</p>	<p>Methods of analysis Proportions.</p>

Appendices for evidence review of TB Service Delivery

<p>Follow up period NA</p>	
<p>Service delivery results</p>	
<p>Diagnostic delay (referred to as prompt diagnosis) Prompt diagnosis was reported in two metrics: TB samples processed with liquid culture technology and all sputum smears should be available within one working day of sample reaching laboratory. 29/29 services reported prompt return of sputum smear results were in place. 29/29 services reported use of liquid cultures.</p> <p>Treatment completion Percent notifications completing treatment within one year in 2008 - North Central: 80.0% (456 persons completed treatment) North East: 84.0% (761 persons) North West: 81.6% (929 persons) South East: 85.1% (430 persons) South West: 82.8% (308 persons) London Total: 82.6% (2888 persons) Clinic rates ranged from 61.1% (West Middlesex: 66 persons) – 94.6% (Whipps Cross: 122 persons)</p> <p>Contact tracing Services reported following NICE guidelines for contact tracing (actual number of services reporting this NR). However, as there is no standardised protocol for reporting this, services report they do not have the ability to measure contact tracing as an indicator of service performance.</p>	<p>Other results DOT use during 2009 Overall London: 8.5% (304/3571 notifications) Range: 0% (Bromley) – 31.8% (Mayday)</p> <p>Details on service structure, staffing ratios, and service settings noted in case study background, but not within the full extraction.</p> <p>Attrition details Individual services: In 2008, cases lost to follow-up ranged from 1 case in Newham to 9 lost in Northwick Park and West Middlesex.</p> <p>Sectors: In 2008, ranged from 1.1% (10) notified cases in NE London to 3.2% (35) notified cases in NW London.</p>
<p>Notes and other information</p>	
<p>Author conclusions London needs to be brought under improved control using a London-wide structure for leadership and decision-making. A manual of TB pathways and protocols for London is needed (based on the New York equivalent).</p> <p>Author limitations The present review was a pragmatic survey with the purpose of making broad comparisons and conclusions about London TB services within a limited amount of time. Thus detailed information is limited and often incomplete. Due to the self-reported nature of data provided, the information is subject to bias.</p> <p>Evidence gaps and/or recommendations for future research and policy A number of recommendations were made including the setting up of a TB control board, standardisation of clinical policy and practice, and specific performance metrics.</p> <p>Source of funding Commissioned by the London TB Commissioning Board</p>	<p>Limitation identified by review team Review was conducted prior to restructure of NHS and thus may not reflect structures of current TB services.</p> <p>Review is limited to London and may not be generalisable to service structure, service delivery, and TB population in other parts of UK.</p>

Jit 2011

<p>Authors: Jit, M., Stagg, H.R., Aldridge, R.W., White, P.J., & Abubakar, I. Year: 2011 Citation: Dedicated outreach service for hard to reach patients with tuberculosis in London: observational study and economic evaluation. <i>BMJ</i>, 343. Location: London, UK Aim of study: Overall aim was to determine cost effectiveness of the Find and Treat service. The economic data has previously been extracted. This extraction is of the clinical data from a retrospective cohort which was used to inform the compartmental model. Study design: Economic evaluation alongside a cohort study Quality score: ++ (economic evaluation checklist) External validity score: ++ (economic evaluation checklist)</p>	
<p>Population and setting</p>	
<p>Source population Persons with TB in London.</p> <p>Eligible population Persons with active TB who were targeted by the Find and Treat service for being in a hard to reach group. Hard to reach groups defined as persons in drug treatment services, and hostels or day centres for homeless and impoverished people.</p> <p>Selected population Persons with records in the Find and Treat database between September 2007 and September 2010.</p> <p>Excluded population Persons with non-pulmonary TB as this wouldn't be detected by chest x-ray.</p>	<p>Population characteristics (Intervention v Comparator) NR</p> <p>Setting Community, including hostels, homeless shelters and day centres</p> <p>Location London, UK</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding Comparators were age matched with persons detected by Find and Treat services and had one or more risk factors. Risk factors included history of homelessness or imprisonment, drug or alcohol abuse, or mental health issues.</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 668 Intervention N= 416 (48 identified by mobile screening unit, 188 cases referred for case management support, 180 cases referred for loss to follow-up) Comparator N= 252</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Mobile radiography unit was set up to screen vulnerable populations on a voluntary basis. Purpose of this Find and Treat service was to screen and find active cases, raise awareness, undertake case holding, and support treatment completion for the hard to reach groups.</p> <p>Collaborated with drug and alcohol support services, hostels, and street outreach and criminal justice services to find vulnerable persons.</p> <p>Comparator Persons with TB in London who presented to London TB services on their own without screening or referral (i.e. passively presented cases), and whose treatment records were in London's enhanced tuberculosis surveillance system.</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Treatment completion. Loss to follow-up. Diagnostic delay.</p> <p>Follow up period NA</p>	<p>Methods of analysis Proportions for clinical data. Economic evaluation used a discrete, multiple age cohort, compartmental model.</p>
<p>Service delivery results</p>	

Appendices for evidence review of TB Service Delivery

<p>Treatment completion (intervention v comparator) Previously untreated cases referred for treatment after screening- If in first year of treatment: 54.6% v 46.2% If in subsequent year of treatment: 67.1% v 56.8%</p> <p>Cases referred to Find and Treat service for case management support due to complex issues: 61.2% v 51.7%</p> <p>Cases under treatment referred to Find and Treat service because of loss to follow-up: 41.0% v 40.8%</p> <p>Diagnostic delay Estimated proportion of patients with the longest delays between symptom onset and treatment presentation found by Find and Treat service who likely would not have presented for treatment otherwise: 22.9%</p>	<p>Other results Economic results presented in economic extraction sheet.</p> <p>Attrition details – intervention v comparator Lost to follow-up after one year in previously untreated cases: 2.1% v 17.2% Lost to follow-up after one year in complex patients: 2.6% v 34.7%</p>
Notes and other information	
<p>Author conclusions Find and treat is cost-effective.</p> <p>Author limitations The model used was based on patients with at least one risk factor in London's enhanced tuberculosis surveillance system who presented for care. However, the Find and Treat service often manages hard to reach patients who would not present for care in the absence of the service. Due to the lack of randomisation between cases managed and not managed by the Find and Treat service there some uncertainty about the robustness of the outcomes, which may have underestimated the benefit of the service.</p> <p>Evidence gaps and/or recommendations for future research and policy The authors recommend study use of "point of care testing" within community outreach settings, such as with the mobile x-ray unit. They also recommend a randomised trial evaluate patients who are and are not managed by the Find and Treat service to confirm estimates of the service's benefits.</p> <p>Source of funding English Department of Health</p>	<p>Limitation identified by review team Methods of study were focused on modelling cost effectiveness of the service rather than measuring the outcomes and benefits of the service itself.</p> <p>In addition, the service was used among hard to reach groups in London and may not be generalisable to other populations.</p>

London Health Programmes 2011

<p>Authors: NHS publication[#] Year: 2011 Citation: Case for change: TB services in London. London Health Programmes. NHS. Location: London, UK Aim of study: Aim of report was to describe specific problems with the way TB services in London were planned, organised and managed. For the purpose of the present review results on treatment completion were extracted. Study design: Local report Quality score: Not addressed by CA External validity score: Not addressed by CA</p>	
Population and setting	
<p>Source population Persons with TB in London.</p> <p>Eligible population Persons with TB receiving care from services within the five Primary Care Trusts (PCTs) within London.</p> <p>Selected population Persons receiving TB care from London PCTs during 2010.</p> <p>Excluded population NR</p>	<p>Population characteristics (Intervention v Comparator) NR</p> <p>Setting TB services within PCTs in London during 2010.</p> <p>Location London, UK</p>
Methods of allocation to intervention/control	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 3,302 new TB cases in London in 2010; sample size from treatment completion results NR. Intervention N= NA Comparator N= NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Current practice in different TB services across London PCTs in 2010. NR how data for treatment completion results were collected.</p> <p>Comparator Treatment completion compared to 85% completion target set by Chief Medical Officer for England, which is based on the WHO target.</p>
Outcomes and methods of analysis	
<p>Outcomes Treatment completion.</p> <p>Follow up period NR</p>	<p>Methods of analysis Proportions.</p>
Service delivery results	
<p>Treatment completion Proportion new TB notifications among London residents completing treatment within one year of notification in 2010: South East: 88.9% North Central: 87.6% South West: 86.9% North West: 86.7% North East: 85.1%</p>	<p>Other results NA</p> <p>Attrition details NR</p>

Appendices for evidence review of TB Service Delivery

<p>London total: 86.6%</p> <p>Treatment completion rates fell below 85% in: Camden, Islington, City & Hackney, Havering, Redbridge, Tower Hamlets, Hammersmith & Fulham, Hillingdon, Hounslow, Bromley, Kingston, and Richmond & Twickenham. Treatment completion rates were lowest in Tower Hamlets (79%).</p>	
Notes and other information	
<p>Author conclusions Although the London proportion of new TB cases successfully completing treatment was slightly above the target of 85%, rates varied across PCTs with several scoring below the target.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy A number of recommendations were set out in a separate report (Model of Care for London) around: early detection and diagnosis of treatment; improving commissioning; and addressing variability in practice.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team The reasons for differences in treatment completion rates across London were not fully discussed.</p>

Linked to model of care also, but no additional results for extraction.

Story 2009

Browne 2013

<p>Authors: Browne, C., Munang, M.L., Evans, J.S., Smith, E.G., Khanom, S., Hawkey, P., Kunst, H., Welch, S., & Dedicoat, M. Year: 2013 Citation: Impact of TB Cluster Investigation in a New Migrant Community. Thorax, 68(Suppl 3), A119. Location: High incidence area, UK Aim of study: The aim was to identify whether a social network cluster investigation could identify whether recent TB transmission had occurred within a new migrant community. Study design: Local report Quality score: Not addressed by CA External validity score: Not addressed by CA</p>	
<p>Population and setting</p>	
<p>Source population Persons with TB in a high incidence area, UK. (Possibly limited to Birmingham but not clear)</p> <p>Eligible population Persons with TB originating from a single country in a new migrant community in a high incidence area.</p> <p>Selected population Persons with TB originating from a single country residing in a high incidence area from 2009-2012.</p> <p>Excluded population NR</p>	<p>Population characteristics (Intervention v Comparator) Median number of years in UK: 4</p> <p>Setting Private homes and places of worship in a new migrant community in a high incidence area, UK.</p> <p>Location Urban - high incidence area , UK.(Possibly limited to Birmingham)</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 66 occurred between 2009-2012 Intervention N= 56 of 66 cases interviewed Comparator N= NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Following clinicians and nurses identifying a sharp increase in TB cases originating from a single country, a social network approach to cluster investigation was undertaken to identify whether recent transmission had occurred. The team undertook interviews in private homes, performed MIRU-VNTRs strain typing*.</p> <p>Comparator NA</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Contact tracing. Treatment completion. Epidemiological links. MIRU-VNTRs strain typing*. Screening completion.</p> <p>Follow up period NA</p>	<p>Methods of analysis Proportions. Interquartile range.</p>
<p>Service delivery results</p>	
<p>Contact tracing Interviewed in homes: 85% (56/66) Epidemiologically linked to index case#: 23 MIRU-VNTRs* strain typing available: 79% (19/24) Additional contacts self-identified for screening: 77 Of these patients, 77% (59/77) completed screening.</p>	<p>Other results As a result of the cluster investigation the Tb service were invited to speak at a religious service and two community members became involved in raising awareness.</p> <p>Attrition details NR</p>

Appendices for evidence review of TB Service Delivery

<p>Treatment completion</p> <p>LTBI cases treated: 16 BCG vaccinations administered: 7 Undergoing assessment: 13</p>	
<p>Notes and other information</p>	
<p>Author conclusions The social network cluster investigation built trust within the new migrant community to allow access to TB services. The community has an increased awareness of TB which will reduce diagnostic delays in the future.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy NR</p> <p>Source of funding NR</p>	<p>Limitation identified by review team The present article is an abstract and thus provides limited detail on the intervention implemented and population demographics.</p>

Index case was a prominent community member who had been symptomatic for 10 months.

* MIRU-VNTRs: 24 loci mycobacterial interspersed repetitive unit-variable number tandem repeats strain typing. 12 cases had identical strain type to index case.

King 2009

<p>Authors: King, R., Carter, M.J., Mungall, S.B., & Hetzel, M.R. Year: 2009 Citation: Does a Specialist TB Nurse Service Improve Outcome? Thorax, 64(Suppl IV), A121-122 Location: Bristol, UK - Urban Aim of study: The aim of the study was to retrospectively evaluate whether two community-based TB nurses could improve treatment compliance and improve cost-effectiveness compared to the former hospital-based clinic system. Study design: Before and after study Quality score: + External validity score: ++</p>	
Population and setting	
<p>Source population Persons with TB in Bristol, UK.</p> <p>Eligible population Persons with TB</p> <p>Selected population Persons referred to TB</p> <p>Excluded population Persons with TB partially treated prior to referral, given chemoprophylaxis, changed diagnosis or died within first month of treatment.</p>	<p>Population characteristics (Intervention v Comparator) NR</p> <p>Setting Retrospective evaluation of case records of TB patients referred to two community-based TB nurses in Bristol.</p> <p>Location Bristol, UK.</p>
Methods of allocation to intervention/control	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 147 Intervention N= 64 (64 of 117 referred patients suitable for audit) Comparator 1 N= 22 Comparator 2 N= 61</p> <p>Baseline comparisons NR</p> <p>Power of study NR</p>	<p>Intervention Two community-based TB nurses were appointed by the Bristol primary care trust (PCT) to improve treatment compliance among patients with TB and cost-effectiveness.</p> <p>Comparator 1 – “2006a” Audit of the previous hospital-based system of monthly clinics during 31 August 2005 – 28 February 2006.</p> <p>Comparator 2 – “2006b” Information from cases notified to the Health Protection Agency in 2006.</p>
Outcomes and methods of analysis	
<p>Outcomes Treatment completion. Proportion patients given TB nurses’ contact details within two days. Face-to-face and telephone contacts undertaken by TB nurses.. HIV counselling. Assessed for DOT. Uninterrupted medication. Monthly reviews. Mean proportion clinic or community reviews not attended. Financial data from April 2008 – March 2009 also</p>	<p>Methods of analysis Proportions. Fisher exact test. Student <i>t</i> test.</p>

Appendices for evidence review of TB Service Delivery

<p>presented for cost-effectiveness analysis of service compared to previous hospital-based system.[#]</p> <p>Follow up period NA</p>	
Service delivery results	
<p>Treatment completion 2008: 94% (56/59) 2006a: 84% (16/19) 2006b: 55% (32/58) ($p < 0.0001$)</p> <p>Uninterrupted medication: 2008: 92% (59/64) 2006a: 15% (3/20) 2006b: - ($p < 0.0001$)</p> <p>Assessed for requiring DOT: 2008: 92% (59/64) 2006a: 5% (1/22) 2006b: - ($p < 0.0001$)</p>	<p>Proportion patients given TB nurses' contact details within two days: 97% (62/64)</p> <p>Face-to-face and telephone contacts undertaken by TB nurses: Total: 771 Mean contacts per patient : 15</p> <p>Counselling regarding HIV in first month: 2008: 69% (44/64) 2006a: 32% (7/22) 2006b: - ($p < 0.005$)</p> <p>Attrition details NR</p>
Notes and other information	
<p>Author conclusions The TB nurse service introduced led to statistically significant improvement in all standards audited. Thus, the service provides better care than previous hospital-based clinics and improved attendance.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy NR</p> <p>Source of funding NR</p>	<p>Limitation identified by review team As the paper is an abstract limited information is provided for population demographics and the intervention implemented.</p>

Monk 2014

<p>Authors: Monk, P. Year: 2014 Citation: "Tuberculosis in Leicestershire". Annual TB Update 2014. Public Health England. P.6 Location: Leicestershire, UK Aim of study: The aim was to assess whether a rapid access service for patients with suspicious x-rays and positive microbiology could reduce diagnostic delay and the overall burden of TB in Leicester. Study design: Regional report Quality score: Not addressed by CA External validity score: Not addressed by CA</p>	
Population and setting	
<p>Source population Persons with suspected TB in Leicestershire, UK.</p> <p>Eligible population Persons with suspected TB in Leicestershire, UK.</p> <p>Selected population Persons with suspected TB in Leicestershire, UK.</p> <p>Excluded population NR</p>	<p>Population characteristics (Intervention v Comparator) NR</p> <p>Setting Services providing TB care in Leicestershire.</p> <p>Location Leicestershire, UK.</p>
Methods of allocation to intervention/control	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= NR Intervention N= NR Comparator N= NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention In 2005 a rapid access service (modelled on approach for lung cancer) was established to enable GPs to rapidly assess patients with suspected TB. This was done by linking radiology and microbiology to the TB service so patients with suspicious x-rays and positive microbiology would be offered next day appointments.</p> <p>Comparator A comparison was made over time, with data on outcomes available from 2001 onwards before the introduction of rapid access service.</p>
Outcomes and methods of analysis	
<p>Outcomes Annual number of TB cases in Leicestershire. Number of TB cases broken down by TB type (non-pulmonary, pulmonary smear positive and pulmonary smear negative) and by culture results (positive and negative).</p> <p>Follow up period NA</p>	<p>Methods of analysis NR</p>
Service delivery results	
<p>TB cases per year in Leicestershire: 2001: 340 2002: 257 2003: 284 2004: 237 2005: 308 --> Year rapid access service introduced 2006: 275 2007: 270 2008: 242 2009: 255 2010: 251</p>	<p>Other results The number of TB cases from 2005-2013 by TB type (non-pulmonary, pulmonary smear positive and pulmonary smear negative) and by culture results (positive and negative) are presented on a bar graph. However, the numbers of cases cannot be extracted.</p> <p>Attrition details NR</p>

Appendices for evidence review of TB Service Delivery

<p>2011: 223 2012: 224 2013: 196</p>	
Notes and other information	
<p>Author conclusions The introduction of a rapid access service and establishment of a TB Board for Leicester has impacted on the smear positive cases, reducing the burden of infection and reducing the overall number of TB cases.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy NR</p> <p>Source of funding NR</p>	<p>Limitation identified by review team The present article is a small part of a larger TB report and provides very limited data on the intervention implemented. No data is provided on the number of patients who used this service or their specific outcomes. It also is not clear if any other changes to TB services or the rate of TB in Leicestershire occurred during the study period which may have accounted for some of the changes in TB cases.</p>

Verma 2011

<p>Authors: Verma R, Lee J, Halder P, and Woltmann G. P54 Impact of rapid access system for the early referral of suspected TB cases. Thorax 66: A90. Year: 2011 Citation: Impact of rapid access system for the early referral of suspected TB cases. Thorax 66: A90. Location: UK - Urban Aim of study: The aim of the study was to evaluate whether differences exist in disease characteristics and time to diagnosis with the rapid referral system, compared with other diagnostic pathways. Study design: Retrospective cohort study Quality score: + External validity score: +</p>	
<p>Population and setting</p>	
<p>Source population Persons with TB in Leicester</p> <p>Eligible population Patients referred to rapid access TB clinic with TB in Leicester between 2005 and 2010</p> <p>Selected population Patients diagnosed with TB between 2007 and 2009</p> <p>Excluded population NR</p>	<p>Population characteristics (intervention v comparator) Mean age: 36.4 v 41.6 years ($p>0.05$); male: 54% v 51% ($p>0.05$); from Indian subcontinent: 191 v 226 ($p>0.05$); pulmonary smear positive TB: 32 v 35 ($p>0.05$); pulmonary smear negative TB: 41.6 v 16.2 ($p0.03$); non-pulmonary TB: 26 v 48 ($p0.04$).</p> <p>Setting Health service</p> <p>Location: Leicester, UK</p>
<p>Methods of allocation to intervention/control</p>

UK Rural (1 study)

Abubakar 2006

<p>Authors: Abubakar, I., Chalkley, D., McEvoy, M et al. Year: 2006 Citation: Evaluating compliance with national guidelines for the clinical, laboratory and public health management of tuberculosis in a low-prevalence English district. Public health. 120:155-60 Location: Aim of study: 1) to review the clinical management of TB; 2) to determine if all cases of TB in a local hospital were reported to the 'proper officer'; 3) to ascertain the extent of follow-up of identified contacts Study design: Audit Quality score: Not available from CA checklist used External validity score: Not available from CA checklist used</p>	
<p>Population and setting</p>	
<p>Source population TB cases in rural England district (East and North Hertfordshire)</p> <p>Eligible population Any patients with confirmed TB in the targeted area</p> <p>Confirmed TB case defined as either culture-confirmed TB or based on clinician's judgement, clinical and/or radiological signs and/or symptoms compatible with TB diagnosis and on whom clinician decided to treat with full course of anti-TB treatment</p> <p>Selected population Eligible patients who attended between 1 April 2002 and 30 November 2003</p> <p>Excluded population NR</p>	<p>Population characteristics 46.9% Female; Median age: 48.5 years; 40.6% Caucasian; 37.5% Indian Subcontinent; 47% (15/32) non-UK-born; 62% pulmonary TB; 45.5% HIV positive (of 11 tested)</p> <p>Setting District general hospital</p> <p>Location UK - rural</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy Search of all statutory notifications of cases to the proper officer, district enhanced surveillance database, pathology database, local microbiology laboratory data, hospital administration records, paper records held by TB nurse and the pharmacy database.</p> <p>Sample sizes: Total sample N= 32 Intervention N= NA Comparator N= NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Audit (2002/2003) of standards for clinical and public health management using national guidelines on management of TB (British Thoracic Society and Interdepartmental Working Group on Tuberculosis) Standards on: --public health (including notification and follow-up of close contacts) management of patients by an 'appropriate clinician' -facilities and support -case management -measures to reduce transmission</p> <p>Comparator NA</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Contact tracing. Compliance with published guidance in relation clinical management, including care plans, management by appropriate clinician.</p>	<p>Methods of analysis Percentages and summary measures, Fisher's exact test, t-test</p>

Appendices for evidence review of TB Service Delivery

Follow up period NA	
Service delivery results	
<p>Results TB cases reported to 'proper officer': 81.2% (26/32) cases reported to 'proper officer' 90.6% were on TB treatment 2 not on treatment at time of audit due to adverse reactions – subsequently resumed therapy.</p> <p>Follow-up of contacts: 82% had 2-24 contacts (2 cases had wider contacts) 73.4% (91/124) contacts seen by specialist nurse 2 patients refused to give contact names 54.9% contacts had BCG scar/history 7 needed treatment 3 had abnormal chest x-ray</p> <p>Clinical management of contacts: 83% (24/29) reported no difficulties complying with treatment Compliance rates did not significantly vary by age, ethnicity, gender or place of birth. 12 days (SD 13) average referral time to respiratory physician (11/32 had a recorded referral time) 12.9 h (SD 46.6h) average time from requesting the chest x-ray results to reaching the managing clinician 19% patients were not notified (2 were 'out-of-district') All TB/HIV co-infected notified to proper officer (GUM clinics not aware of 1 patient) 18 admitted to hospital: 55% had risk assessment prior to admission; 61% (11/18) care plan in case notes</p>	<p>Other results 'Several cases' were encountered where the national recommendation of minimum 1 nurse for every 50 notifications per year did not provide enough resources</p> <p>21 had sputum smear test for AFB – 48% positive (average 9.3 days, SD 23.5 days to obtain result) 52% (13/22 tested) had culture + disease 2 drug-resistant TB</p> <p>Attrition details During audit process: 7 died (1 unrelated to TB)</p> <p>Missing data (32.3%) for outcome of care.</p>
Notes and other information	
<p>Author conclusions The findings of this audit were used to improve the process of hospital infection control and links between microbiologists, clinicians and public health doctors in the management of tuberculosis. A small number of patients are still not notified. Ensuring TB specialist nurse early in course of illness improves initiation of prompt contact tracing. Guidelines definitions of casual and close contacts are not clear enough in practice, which can lead to difficulties in contact tracing. Anxiety among clinical and non-clinical staff in low-prevalence areas is not recognised enough and this can complicate the management of contacts.</p> <p>Author limitations Small sample size limits generalisability</p> <p>Evidence gaps and/or recommendations for future research and policy Recommend the routine monitoring of national standards within the hospital. Availability of rapid diagnostic tests would improve care by limiting delayed diagnosis.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team Retrospective data collection for 28% (9/32) of patients.</p>

UK Prison (1 study)

Ahmed 2007

<p>Authors: Ahmed, S., Newton, A., & Allison, T. Year: 2007 Citation: Tuberculosis in a Yorkshire Prison: Case Report. No cases were detected.</p> <p>Attrition details</p>

Appendices for evidence review of TB Service Delivery

<p>Number of people quantiferon positive = 3/34 Prisoners from training course contacts = 1/19 Close friend contact = 1/1 Prison officer contacts = 1/2 Teacher contacts = 0/2</p> <p>Number of people with abnormal chest x-ray = 1/34 Close friend contact = 0/1</p> <p>Number of people receiving therapy = 3/34 Prisoners from training course contacts = 1/19 given 2 months prophylaxis Close friend contact = 1/1 given 6 months therapy Prison officer contacts = 1/2 given 3 months prophylaxis</p>	<p>Courses contacts: 1 refused 4 prisoners released prior to screening (2 did not attend screening, 2 unknown attender/non-attender)</p> <p>Teacher contacts: 1 declined Heaf test but completed blood test and chest x-ray</p>
Notes and other information	
<p>Author conclusions The agreed upon selection criteria, screening tools and effective integrated community and hospital TB service resulted in the successful management of the incident. Challenges of dealing with TB in prisons include:</p> <ul style="list-style-type: none"> • Movement of prisoners from one prison to another • Prisoner behaviour (e.g. tampering with tests) • Concerns/attitudes of prison staff • Relatively low prevalence leading to diagnostic delay <p>Although guidelines are available for the management of TB in the community (for example, BTS and NICE guidelines) these may not be entirely suitable in a specialist setting and additional pragmatic measures may be necessary.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy It would be helpful if prison regulations allowed for restriction on movement of prisoners during investigation of a case or outbreak of a communicable disease. Development of mechanism to improve medical follow-up of released prisoners would be valuable. Need to raise awareness of TB among prisoners, prison officers and health care workers working in prisons.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team No data analysis, only frequencies reported</p>

New York City (5 studies)

Anger 2007

<p>Authors: Anger HA, Proops D, Harris TG, et al. Year: 2012 Citation: Active case finding and prevention of tuberculosis among a cohort of contacts exposed to infectious tuberculosis cases in New York City. CID, 2012, 54:1287-95. Location: New York City, USA. Aim of study: To assess the impact of contact investigation as an active case-finding modality and an opportunity for TB prevention. Study design: Retrospective cohort study. Quality score: + External validity score: +</p>	
<p>Population and setting</p>	
<p>Source population Contacts of people with TB in NYC between 1997 and 2003.</p> <p>Eligible population Contacts of people with TB in NYC who had a known date of birth, were living in NYC, did not have an index case with MDR-TB, and did not have an index case aged 5 years old or less.</p> <p>Selected population Contacts of people with TB in NYC who could be evaluated.</p> <p>Excluded population People died during contact investigation, relocated during contact investigation, treated for active TB within 1 year prior to diagnosis of index case.</p>	<p>Population characteristics (contacts without prevalent TB) Index TB case: 56% aged 18-44; 19% HIV co-infected; 24% unknown HIV status; 59% male. Contact of TB case: 46% aged 18-44; 1% HIV co-infected; 88% unknown HIV status; 49% male.</p> <p>Setting Community</p> <p>Location Urban – NYC</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N=36,606 contacts (of 5731 cases) Intervention N=30,561 contacts (of 5,182 cases) Comparator N=NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention NYC TB service, with a focus on contact investigation.</p> <p>Comparator NA</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Proportion of contacts screened, LTBI diagnosis, chemoprophylaxis initiation, treatment completion.</p> <p>Follow up period Contacts were retrospectively followed up for 4 years after exposure.</p>	<p>Methods of analysis Poisson regression, clustered cox proportional hazards regression, absolute risk reduction with 95% confidence intervals, and multivariate analysis.</p>
<p>Service delivery results</p>	
<p>Contact tracing outcomes 89% of contacts were eligible for TST testing (27,363/30,561) 27.1% were TST-positive (8,270) 48% were TST-negative (14,654)</p>	<p>Development of active TB 46/6001 contacts developed active TB during the 4 year follow up 22 of the cases had initiated chemoprophylaxis</p>

Appendices for evidence review of TB Service Delivery

<p>7.2% were not tested (2,199) 7.3% were window-negative TST (2,240) 1% active TB (378)</p> <p>Treatment completion 47.9% completed LTBI treatment (3,642) 29.2% did not complete LTBI treatment (2,219) 21% did not start LTBI treatment (1,596) 1.8% stopped LTBI treatment due to adverse events (140)</p>	<p>24 had not initiated treatment</p> <p>The absolute risk reduction afforded by chemoprophylaxis was 1.1% (95% CI 0.6% to 1.9%).</p> <p>Number needed to treat to prevent 1 TB case was 88 contacts (95% CI 53 to 164) within 4 years of exposure.</p> <p>Attrition details NA</p>
Notes and other information	
<p>Author conclusions Contact investigation facilitates active case finding and TB prevention, even with suboptimal chemoprophylaxis completion rates.</p> <p>Author limitations Due to the fact the study used data collected for routine purposes many contacts had missing data, including details on HIV status. The study was also unable to account for incident TB among contacts who moved outside of NYC.</p> <p>Evidence gaps and/or recommendations for future research or policy The effectiveness of contact investigation would likely be improved if chemoprophylaxis uptake and completion rates were increased through the use of shorter but equally effective chemoprophylaxis regimens.</p> <p>Source of funding NYC Department of Health and Mental Hygiene, Bureau of TB control.</p>	<p>Limitation identified by review team Due to the nature of the study there is the potential for a high degree of confounding. This was not controlled for or discussed.</p>

Munsniff 2006a

<p>Authors: Munsiff, S. S., Ahuja, S. D., King, L. et al. Year: 2006 Citation: Ensuring accountability: the contribution of the cohort review method to tuberculosis control in New York City. International Journal of Tuberculosis Lung Disease 2006, 10:10 Location: New York City Aim of study: To describe the methodology to implement cohort review in a large urban TB control program and make suggestions on how to initiate it in a variety of settings. Study design: retrospective cohort study Quality score: + External validity score: +</p>	
<p>Population and setting</p>	
<p>Source population TB cases (as defined by CDC) in NYC reviewed by the Bureau of Tuberculosis Control (BTBC) at cohort review meetings.</p> <p>Eligible population All TB cases reviewed by the NYC BTBC cohort review meetings in 2004.</p> <p>Selected population All new and retreatment TB cases presented during the 16 cohort review meetings in 2004.</p> <p>Excluded population NA</p>	<p>Population characteristics (2004 sample) 57.1% sputum culture-positive <i>M. tuberculosis</i>; 64.7% positive sputum AFB smear results; 17.8% had <i>M. tuberculosis</i> isolated by culture from another respiratory specimen; 16.3% HIV-infected.</p> <p>Setting Community</p> <p>Location Urban – New York City</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= number of cases registered from 1989-2004 presented on graph and unable to extract figures. Intervention N=1039 (TB cases in 2004) Comparator N=1433 (TB cases in 1999)</p> <p>Baseline comparisons NA</p> <p>Power of study NA</p>	<p>Intervention The NYC BTBC cohort review process* in 2004. This included a review of epidemiology, individual patient history and treatment, and assessment against national targets. As each case is presented cases are documented. Meetings are quarterly and results are sent to managers. *(BTBC developed the cohort review process in 1993)</p> <p>Comparator "outcome indicators of [cohort review of]1999 TB cases were also reviewed as an arbitrary (5 years back) point of comparison."</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Contact tracing. 'Treatment completion' = cases who completed treatment within 365 days of treatment initiation. 'Likely to complete' cases = not completed treatment at the time of cohort, but, barring any unforeseen complications, are likely to complete treatment within 365 days of treatment initiation. 'Cohort failures' = did not complete treatment within 365 days due to treatment problems or poor adherence. Issues identified during cohort review meetings:</p>	<p>Methods of analysis NR</p>

Appendices for evidence review of TB Service Delivery

<p>Data issues(incorrect, unclear or unknown patient information); treatment issues(follow-up of drug regimen, clinical diagnosis, clinical procedures); case management issues (execution of standard procedures with TB cases); education and training issues (outreach to the community, private providers and/or Bureau of TB Control staff);contact investigation issues (e.g. not identified or delayed or not done);epidemiology issues (cases requiring expanded contact investigations and high-risk cases e.g. health care workers or cases living in congregate settings).</p> <p>Follow up period Each case followed by cohort review meetings until discharge from TB care</p>	
Service delivery results

Appendices for evidence review of TB Service Delivery

Patients on DOT: +6.1%	
Notes and other information	
<p>Author conclusions Cohort review process is the BTBC's most important method of programme evaluation. A systematic review of every TB case improved the quality of patient information, enhanced patient treatment and ensured accountability at all levels of the TB control program. Cohort review was considered an important method of programme evaluation for tracking national objectives and quantifying how TB control in NYC has improved and key to improving patient outcomes. The principles of the NYC cohort review process can be applied to areas of high and low TB incidence.</p> <p>Author limitations Although there was improved patient care, limitations of the cohort review process was that they are time- and labour-intensive and are undertaken 5-8 months after treatment initiated, therefore some aspects of care cannot be assessed and it may be too late to intervene.</p> <p>Evidence gaps and/or recommendations for future research and policy The general principles of cohort review can be applied to a broad range of public health issues, any programme that monitors and evaluates outcomes of patients or that requires intensive case management using a team of staff can use this method.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team This is specific to the NYC TB system: case management system, coordination of the BTBC and funding.</p>

Munsniff 2006b

<p>Authors: Munsiff, S. S., Ahuja, S. D., Li, J. et al. Year: 2006 Citation: Public-private collaboration for multidrug-resistant tuberculosis control in New York city. <i>Int. J. Tuberc. Lung Dis.</i> 10:6 Location: New York City Aim of study: To evaluate treatment outcomes of primary multi drug-resistant tuberculosis (MDR-TB) patients treated by multiple providers. Study design: Retrospective cohort study Quality score: + External validity score: +</p>	
<p>Population and setting</p>	
<p>Source population People with MDR-TB in New York City</p> <p>Diagnosis date of MDR-TB was defined as the collection date of the first specimen from which an MDR <i>M. tuberculosis</i> strain was isolated.</p> <p>Eligible population All MDR-TB cases in NYC from 1 January 1992 - 31 December 1997.</p> <p>Selected population Patients with <i>Mycobacterium tuberculosis</i> isolates resistant to at least isoniazid and rifampin, and who had ≤30 days of anti-tuberculosis treatment prior to the collection of the first MDR-TB specimen</p> <p>Excluded population Non-drug resistant TB MDR-TB cases with >30 days treatment prior to collection of the initial MDR-TB specimen</p>	<p>Population characteristics (whole cohort) Pulmonary (only) TB: 67% ; Combined pulmonary & extrapulmonary TB: 21%; Extrapulmonary (only) TB: 12%; median age: 39 years s range 4-90); Male: 68%; US-born: 81%; HIV-infected: 60%; died prior to treatment completion: 57%; positive culture within 30 days of death: 51%</p> <p>There was no difference in relation to race/ethnicity, homelessness, borough of residence, respiratory smear status (for pulmonary patients) over the study period.</p> <p>Setting Urban TB control programme where enhanced MDR-TB management plan coordinates with multiple providers.</p> <p>Location Urban - NYC</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy All MDR-TB patients from the NYC BTBC TB Registry during the study time period</p> <p>Sample sizes: Total sample N= 856 Intervention N= 553 (1993-1997 service; n=46 in 1997 service) Comparator N= 303 (1992 service)</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Service in 1997: From 1993 onwards a central MDR-TB Surveillance Coordinator oversaw regional MDR-TB coordinators assigned to each of the 5 NYC boroughs. Regional MDR-TB staff coordinated flow of information to all concerned parties, including BTBC staff and the medical provider. MDR-TB case management was in addition to standard case management practices in place</p> <p>Comparator Service in 1992: no specific MDR-TB unit or centralised MDR-TB surveillance coordinator. Direct observation of treatment was the 'standard of care' but voluntary in most cases.</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Treatment completion defined as at least 18 months of MDR-TB treatment with at least 12 months of treatment following the last negative culture</p> <p>Treatment failure defined as positive culture ≥5 months after</p>	<p>Methods of analysis χ^2 test, linear regression, Cox proportional hazards model</p>

Appendices for evidence review of TB Service Delivery

<p>starting MDR-TB treatment, regardless disease site Death before treatment completion.</p> <p>Relapse defined as positive culture occurring after treatment completion</p> <p>Follow up period Until transferred out of NYC, were lost to follow-up prior to treatment completion, death, date of relapse or until 31 January 2001. Follow-up after treatment completion was passive.</p>	
Service delivery results	
<p>Results</p> <p>Treatment completion Whole cohort = 27% Rates improved significantly over study period: 43.5% in 1997 vs 11.6% in 1992 ($p < 0.001$)</p> <p>Of patients given MDR-TB treatment ($n=610$): Treatment completion: 37.2% (227/610)</p> <p>By HIV status ($n=856$): HIV-infected = 17% (87/512) Non-HIV-infected = 59.3% (105/177) HIV unknown = 21% (35/167) Factors associated with treatment completion stratified by HIV status showed that patients with HIV-infection were more likely to complete if diagnosed later in study period or had cavity chest radiograph.</p> <p>Death prior to treatment completion Whole cohort = 57.2% (490/856) The proportion of patients who died prior to treatment completion: 39.1%(18/46) in 1997 vs 69.0% (209/303) in 1992 ($p < 0.001$) Patients given MDR-TB treatment ($n=610$) = 44.4% (271/610) Patients who received treatment but not MDR-TB treatment (175/856) = 92% (70.9% HIV-infected) Patients who received no treatment (71/856) = 90.1%</p> <p>Treatment failure HIV-infected = 17.4% (89/512) Non-HIV-infected = 17.5% (31/177) HIV unknown = 5.4% (9/167)</p> <p>Relapse Of patients who completed treatment (227/610) = 3.5% relapsed (8/227) Overall rate = 1.01 per 100 person-years of follow-up Rate for HIV-infected = 2.06 per 100 person-years of follow-up Rate for non-HIV-infected = 0.52 per 100 person-years of follow-up Rate for HIV status unknown patients = 0.61 per 100 person-years of follow-up ($p = 0.049$).</p>	<p>Attrition details 16.0% (137/856) transferred out, refused treatment or were lost to follow-up</p>
Notes and other information	
<p>Author conclusions A comprehensive MDR-TB control programme improved the outcomes of both HIV-infected and non-infected individuals. Relapse was infrequent among patients who completed the recommended regimens. However, many patients still died before or despite receiving</p>	<p>Limitation identified by review team May not generalise outside of NYC as substantial funding and infrastructure in place to combat MDR-TB in NYC</p>

MDR-TB treatment and a significant proportion were lost to follow-up.
The long duration of MDR-TB therapy can lead to greater risk of non-adherence to treatment.

Author limitations

The authors noted that reasons for changes in drug regimens and choice of particular drugs were not available.
The authors also noted that it was not feasible to collect data on adverse events or analyse outcomes based on specific drug regimen because of the complex individualised regimens/frequent changes due to intolerance.
They also did not have data on some clinical aspects that would have allowed correlation of outcomes with severity of HIV infection or measure the impact of highly active antiretroviral therapy on the survival of HIV-infected patients from 1997 onwards.

Evidence gaps and/or recommendations for future research and policy

Use of evolving technology to obtain more rapid DST results could significantly improve treatment outcomes.

Source of funding

Supported by NYC Department of Health, BTBC programme funds.

Pursnami 2014

<p>Authors: Pursnani, S., Srivastava, S., Ali, S., Leibert, E., & Rogers, L. Year: 2014 Citation: Risk Factors for and Outcomes of Detention of Patients With TB in New York City. MDXU screening began in 2002.</p> <p>Comparator Before the mobile screening was introduced.</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes TB cases found through active screening (contact investigation and screening) found during MDXU. Also reported treatment completion.</p>	<p>Methods of analysis Demographics, including proportions. X^2 tests. Odds ratios. Multivariate logistic regression.</p>

Appendices for evidence review of TB Service Delivery

Follow up period NA	
Service delivery results	
<p>Results During 3 years and 8 months of screening programme the TB prevalence rate was 327 cases per 100,000 radiographs (28 TB cases out of 8559 chest X-rays taken in 3248 people).</p> <p>Proportion cases found through active screening (contact investigations and screening) during MDXU screening v prior to program: 59.2% (42/71) v 29.5% (26/88) ($p < 0.001$)</p> <p>Annual notification rate among illicit drug users/homeless persons: 2005 (after screening): 244 per 100,000 2002 (before screening): 533 per 100,000</p> <p>Proportion smear positive cases among illicit drug users/homeless persons: 2002 – 2005 (after screening): 47.9% (34/71) 1997 – 2001: 58.0% (51/88) 1993 – 1996: 55.3% (26/47) Decrease after screening not statistically significant ($p=0.11$)</p>	<p>Other results Treatment completed during study period (1993-2005) Proportion (illicit drug users/homeless persons v TB cases in Rotterdam without risk profile): 79.1% v 86.8% ($p < 0.05$) Unadjusted OR (95% CI): 0.6 (0.4 – 0.8) ** 25/28 (89.2%) cases identified through MDXU completed treatment.</p> <p>Contact investigations (active case findings): Proportion illicit drug users/homeless v TB cases without risk profile: 40.3% v 16.4% Adjusted OR (95% CI): 3.6 (2.4 – 5.2)</p> <p>Proportion TB cases among illicit drug users/homeless persons: 1993 - 1996: $p = 0.58$ 1997 - 2001: $p = 0.11$ 2002 (MDXU began) - 2005: $p = 0.03$</p> <p>Attrition details NA</p>
Notes and other information	
<p>Author conclusions TB screening among illicit drug users and homeless persons with mobile digital X-ray units reduced the number of notified TB cases among these groups and transmission decreased. DNA fingerprinting is useful for evaluating the impact of screening programmes.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy The authors recommended that TB screening should be continued to prevent a resurgence of TB.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team This study is likely only generalizable to illicit drug users and homeless persons.</p>

Lamberts-van Weezenbeek 2003

<p>Authors: Lambregts-van Weezenbeek, C.S.B., Sebek, M.M.G.G., van Gerven, P.J.H.J., de Vries, G., Verver, S., Kalisvaart, N.A., & van Soolingen, D. Year: 2003 Citation: Tuberculosis contact investigation and DNA fingerprint surveillance in The Netherlands: 6 years' experience with nation-wide cluster feedback and cluster monitoring. Int J Tuberc Lung Dis, 7(12):S463-S470. Location: The Netherlands Aim of study: The aim of the study was to assess whether DNA fingerprint surveillance could enhance contact investigations. Study design: Cohort Quality score: + External validity score: +</p>	
Population and setting	
<p>Source population People with TB in The Netherlands.</p> <p>Eligible population From 1995-2000, TB cultures were standardised by restriction fragment length polymorphism (RFLP) typing. Those that clustered were reported to regional TB nurses, who complete questionnaires on contact investigations and epidemiological links.</p> <p>Selected population Questionnaires from 1995-2000 which clustered were revised. Questionnaires were completed for 91% of eligible cases.</p> <p>Excluded population NA</p>	<p>Population characteristics (Intervention v Comparator) NA</p> <p>Setting Netherlands TB service</p> <p>Location The Netherlands</p>
Methods of allocation to intervention/control	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 3,954 (reported to regional nurses) Intervention N= 3,602 (had completed questionnaires); N=2206 (after cluster feedback) Comparator N= 2206</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention A national program involving voluntary collaboration between regional TB services standardised documentation of restriction fragment length polymorphism (RFLP) typing for all TB isolates. The epidemiological link was confirmed using RFLP patterns and clusters.</p> <p>Comparator The epidemiological link before the RFLP result.</p>
Outcomes and methods of analysis	
<p>Outcomes Proportion of contact investigations that were re-opened or extended due to epidemiological linking of RFLP clusters.</p> <p>Follow up period NA</p>	<p>Methods of analysis Descriptive statistics, including proportions.</p>
Service delivery results	
<p>Proportion contact investigations re-opened or extended: 34/3602 (0.9%) This resulted in detection of 71 contacts with LTBI and 12 cases of smear-negative TB.</p>	<p>Other results Reasons for limited impact of RFLP result on contact tracing:</p>

Appendices for evidence review of TB Service Delivery

<p>Epi links established among clustered cases: After RFLP result: 24% (540/2206) Before RFLP result: 21% (462/2206)</p> <p>Epi links based on documented exposure: After RFLP result: 550 epi links Before RFLP result: 357 epi links This was an increase of 35% ($P < .001$)</p>	<p>Contact took place 1-7 years previously: 51% Documented contact involved in subsequent case in cluster: 21% Casual contact: 15.5% Contact took place in different region: 9% Patient developed TB after passing contact investigation exam: 2%</p> <p>Proportion epi links established via contact investigation but contradicted by RFLP result: 5%</p> <p>Attrition details NA</p>
Notes and other information	
<p>Author conclusions DNA fingerprinting should be considered a complementary strategy which begins when conventional contract tracing ends. DNA fingerprinting has detected institutional deficiencies and provided a justification to address these problems. As such, the authors deemed that the €200,000 used to conduct DNA fingerprinting is money well spent.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy NR</p> <p>Source of funding Netherlands Ministry of Health</p>	<p>Limitation identified by review team There was no attempt to formally assess the cost-impact or cost-effectiveness of the programme; thus the claim of 'money well spent' must be viewed with caution.</p>

Canada (2 studies)

Richards 2005

<p>Authors: Richards, B., Kozak, R., Brassard, P., Menzies, D., & Schwartzman, K. Year: 2005 Citation: Tuberculosis surveillance among new immigrants in Montreal. Int J Tuberc Lung Dis 9(8):858-864 Location: Montreal, Canada Aim of study: Overall aim of study which is out of scope of review – measure performance of LTBI surveillance program among immigrants; Secondary aim which is within scope of review – physician adherence to LTBI management guidelines from Canadian Tuberculosis Standards# Study design: Audit Quality score: CA scores not available External validity score: CA scores not available</p>	
<p>Population and setting</p>	
<p>Source population Immigrants in Montreal, Canada.</p> <p>Eligible population Newly arrived adult Canadian permanent residents who were referred for surveillance of inactive TB between 1999 and 2000.</p> <p>Selected population Immigrant without active TB or without previous adequate treatment for TB.</p> <p>Excluded population Insufficient data to compare physician decisions with Canadian guidelines.</p>	<p>Population characteristics (Intervention v Comparator) → (Patients referred versus not referred: mean ± SD) NR</p> <p>Setting Regionally centralised TB program in Montreal, Canada, based at a TB referral centre.</p> <p>Location Urban - Montreal</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N=493 Intervention N=379 Comparator N=NA</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Physicians' treatment decisions for patients with LTBI</p> <p>Comparator Canadian Tuberculosis Standards.</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Adherence to Canadian Tuberculosis Standards' recommendations for LTBI treatment.</p> <p>Follow up period NA</p>	<p>Methods of analysis Descriptive, including proportions. Odds ratios. t-tests. X² test. Multivariate logistic regression.</p>
<p>Service delivery results</p>	
<p>Results Overall physician adherence to Canadian TB standards Physician treatment decisions adhered to guidelines in 331/379 (87%) patients. When standards recommended treatment: 193/203 (84%)</p>	<p>Other results Multivariate logistic regression indicated patient age and clinician volume only significant predictors of TST and treatment referrals; see adjusted odds ratios below OR (95% CI)</p>

Appendices for evidence review of TB Service Delivery

<p>physicians recommended treatment (correct); 10/203 (7%) did not recommend treatment (incorrect).</p> <p>When standards recommended NO treatment: 138/176 (93%) physicians did not recommend treatment; (correct).38/176 (16%) physicians recommended treatment (incorrect).</p> <p>Clinicians with high-volume of patients more likely to recommend TST and LTBI treatment than clinicians with low-volume of patients :</p> <p>TST: 77% vs. 46% ($p < 0.001$) LTBI treatment: 86% vs. 71% ($p = 0.03$)</p>	<p>Age: per 10-year increase TST: 0.72 (0.62 – 0.83) LTBI treatment: 0.65 (0.51 – 0.83)</p> <p>High-volume clinician: TST: 3.9 (2.3 – 6.6) LBTI treatment: 2.8 (1.2 – 6.8)</p> <p>Attrition details NA</p>
Notes and other information	
<p>Author conclusions Overall physician adherence very good, especially as 93% patients ineligible for treatment appropriately discharged. Performance reduced by failure to refer potentially eligible patients for TST, even in experienced physicians. Decentralised programmes relying on diverse groups of community physicians more likely to perform poorly.</p> <p>Author limitations NR</p> <p>Evidence gaps and/or recommendations for future research and policy NR</p> <p>Source of funding NR</p>	<p>Limitation identified by review team Population limited to immigrants in Montreal. Physician adherence evaluated using Canadian Tuberculosis Standards. Unclear how Canadian Tuberculosis Standards compare to WHO and UK-specific guidelines. Thus, may not be generalizable to broader or international populations.</p>

The main part of this study was on immigrant surveillance which is not within scope of this review. However, the paper did present information on physician adherence to Canadian LTBI guidelines, which is within scope. Only information pertaining to the physician adherence to Canadian LTBI guidelines is extracted here.

Tian 2013

<p>Authors: Tian, Y., Osgood, N.D., Al-Azem, A., & Hoepfner, V.H. Year: 2013 Citation: Evaluating the Effectiveness of Contact Tracing on Tuberculosis Outcomes in Saskatchewan Using Individual-Based Modeling. Health Education & Behavior, 40(1S), 98S-110S Location: Saskatchewan, Canada Aim of study: The aim was to use an agent-based (individual-based) mode of contact tracing (CT) to investigate the effects of CT scope, speed, loss to follow-up, and prioritisation on TB incidence and prevalence in Saskatchewan to improve the effectiveness of CT. Study design: Agent-based modelling (ABM) Quality score: not addressed by CA External validity score: not addressed by CA</p>	
<p>Population and setting</p>	
<p>Source population Aboriginal population in Saskatchewan, Canada.</p> <p>Eligible population NA</p> <p>Selected population The model population constructed was a hypothetical Aboriginal (First Nations tribes) community in Saskatchewan.</p> <p>Excluded population NA</p>	<p>Population characteristics The model population was constructed by initialising each agent (individual) with ethnic and historical attributes, a list of network contacts, and states regarding TB status, aging, and CT status. Population characteristics (ethnicity & age), birth rates, and death rates reflected Saskatchewan demographics and statistics.</p> <p>90% of the population was First Nations individuals. First Nations persons and younger age groups had a higher likelihood of TB infection and progression.</p> <p>Data population was obtained from authors' previous research, Saskatchewan Anti-TB League reports, the Saskatchewan TB Control database and reports, vital statistics for the Saskatchewan population, and secondary literature searches.</p> <p>Gender and family structures not represented by model for sake of simplicity.</p> <p>Setting Hypothetical Aboriginal (First Nations tribes) community Location Saskatchewan, Canada</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NA</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N= 15,000 agents (individuals) Intervention N= NA Comparator N= NA</p> <p>Baseline comparisons Scenarios were compared to a baseline condition of TB in the absence of contact tracing.</p> <p>Power of study NR</p>	<p>Intervention The model produced 900 realisations across a 20-year time horizon to observe long-term outcomes of the four CT targets on cumulative TB cases. The CT parameters were drawn from estimates from Saskatchewan TB Control.</p> <p>CT targets: 1) scope of CT 2) speed of CT 3) degree of loss to follow-up 4) prioritisation for contacts awaiting tracing</p> <p>Comparator TB outcomes when four areas targeted compared to baseline of absence of contact tracing. The average cumulative TB incidence in the absence of CT (baseline) was 411.08 active TB cases.</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Effect of CT scope, speed, loss to follow-up, and prioritisation</p>	<p>Methods of analysis An aggregate model of TB dynamics for the Saskatchewan</p>

Appendices for evidence review of TB Service Delivery

<p>on TB incidence and prevalence.</p> <p>Follow up period NA</p>	<p>population was extended to a network-based ABM with a 20 year time horizon.</p>
Service delivery results	
<p>Scope of CT Difference between average cumulative incidence at baseline (411.08 cases) and in all other scenarios was significant ($p < 0.0001$). Although CT significantly reduced average prevalence of TB in the population, diminished returns were observed as the benefits were greater for the first 45% of contacts than the second 45% contacts.</p> <p>Speed of CT Faster CT did not significantly improve prevention of active TB cases. Faster only obtained a modest reduction in prevalence of TB infection compared to normal speed.</p> <p>Degree of loss to follow-up When 90% contacts were investigated, reducing loss from historic levels of 30-40% to 10%, 15.7 TB cases on average were eliminated, which is a reduction of 5.4% ($p = 0.02$). This had little impact on short-term TB prevalence but had a notable impact in reducing medium- and long-term TB prevalence.</p>	<p>Prioritisation for contacts awaiting tracing Reductions seen in average cumulative incident TB cases when prioritised by... Age: ($p < 0.001$). Ethnicity: ($p = 0.002$) Age + ethnicity: ($p < 0.001$) These priorities also reduced TB infection prevalence, although stats not reported. Prioritising by age and ethnicity yielded an 11% reduction in mean cumulative incident cases. Prioritising CT by the number of times a contact was named during tracing resulted in adverse outcomes, with a mean increase of 26.22 incident TB cases compared to un-prioritised scenarios, or 8% ($p = 0.02$).</p> <p>Attrition details NA</p>
Notes and other information	
<p>Author conclusions Overall, CT strongly benefits TB outcomes. 1) scope of CT – secures diminishing returns as scope increases 2) speed of CT – faster CT only produced a modest reduction in TB prevalence 3) degree of loss to follow-up – can yield significant reduction in TB burden 4) prioritisation for contacts awaiting tracing – prioritising based on age and ethnicity can improve effectiveness of CT</p> <p>Author limitations The CT procedure was added to existing mechanisms drawn from a previous model, and the addition of the CT procedure may have altered the original model's dynamics.</p> <p>Evidence gaps and/or recommendations for future research and policy Future research is suggested in the areas of calibrating the model to ensure dynamics have not been altered by adding the CT procedure. In addition, further research can examine whether prioritising by the number of times an individual is named in CT increases the effectiveness of CT.</p> <p>Source of funding Saskatchewan Health Research Foundation via the Research Alliance for the Prevention of Infectious Disease Network & National Science and Engineering Research Council's Discovery Grant</p>	<p>Limitation identified by review team Several adjustments were made to the model for sake of simplicity, such as ignoring the 4.4% of contacts historically lost between the second skin test and clinical review, and not representing gender or family structures in the model. Results were reported primarily in figures, and thus limited statistics were available for extraction.</p>

Barcelona (1 study)

Ospina 2013

<p>Authors: Ospina JE, Orcau A, Millet J, et al. Year: 2012 Citation: Community health workers improve contact tracing among immigrants with tuberculosis in Barcelona. BMC Public Health 2012, 12:158 Location: Barcelona, Spain Aim of study: To determine the effectiveness of community health workers for contact tracing in a city with recent massive immigration Study design: Quasi-experimental retrospective before and after study Quality score: + External validity score: +</p>	
<p>Population and setting</p>	
<p>Source population People with TB in Barcelona, Spain.</p> <p>Eligible population All TB cases registered by the Barcelona TB control programme between January 1st 2000 and December 31st 2005.</p> <p>Selected population Foreign born TB cases, both pulmonary and extra-pulmonary. A case was defined as an individual who is diagnosed with TB disease and is prescribed anti-TB treatment, including those who prematurely discontinue treatment for any reason</p> <p>Excluded population NA</p>	<p>Population characteristics (Intervention v Comparator) Male: 66.8% v 68.5%; Aged over 40: 18.5% v 21.9%; India-Pakistan: 28.9% v 23.8%; North Africa: 10.8% v 16.1%; Homeless: 7.5% v 8.4%; HIV: 9.3% v 8.6%; extrapulmonary TB: 26.8% v 27.8%.</p> <p>The population characteristics were statistically significantly different between groups for age, ethnicity, and district of residence.</p> <p>Setting Community</p> <p>Location Urban – Barcelona</p>
<p>Methods of allocation to intervention/control</p>	
<p>Method of allocation NA</p> <p>Method to minimise confounding NR</p> <p>Recruitment strategy NA</p> <p>Sample sizes: Total sample N=960 Intervention N=388 Comparator N=572</p> <p>Baseline comparisons NA</p> <p>Power of study NR</p>	<p>Intervention Contact tracing with public health nurses and five community health workers from different immigrant communities (Asia, North Africa, Sub-Saharan Africa, China, and Latin America). The community health worker was a community member of the immigrant community. The goal of the intervention was to increase contacts traced to over 70%.</p> <p>Comparator Contact tracing with public health nurse Limited detail of comparator but some mention that at this period in time the healthcare system was not set up to cope with the large amount of immigration that occurred from high TB endemic countries who did not speak Spanish</p>
<p>Outcomes and methods of analysis</p>	
<p>Outcomes Proportion of contact tracing performed. Contact tracing was defined as at least one contact traced per TB patient.</p> <p>Follow up period 2000-2002 for comparator 2003-2005 for intervention</p>	<p>Methods of analysis Descriptive, including calculating proportions. Odds ratios. X² test.</p>
<p>Service delivery results</p>	
<p>Contact tracing performed in all TB cases Intervention = 66.2% (257/388) Comparator = 55.4% (317/572)</p>	<p>Other results The community health workers conducted active-follow up in 194 TB cases and contact census, 264 individualised</p>

Appendices for evidence review of TB Service Delivery

<p>p <0.001</p> <p>Contact tracing performed in smear positive TB cases Intervention = 81.6% (124/152) Comparator = 65.7% (132/201) p <0.001</p> <p>Adjusted odds of <i>not</i> performing contact tracing in smear positive TB cases in the absence of community health workers OR 2.4 (95% CI 1.3 to 4.3; p=0.005)</p>	<p>and 97 group educational sessions about TB, 280 home visits, 70 hospital visits and 5,935 telephone calls.</p> <p>Attrition details NR.</p>
<p>Notes and other information</p>	
<p>Author conclusions Contact tracing in areas with high immigration can be improved by community health workers who act as translators, cultural mediators and facilitators.</p> <p>Author limitations Variation in population characteristics between time periods. The cost-effectiveness of the intervention was not studied.</p> <p>Evidence gaps and/or recommendations for future research and policy The authors recommended that the community health worker should be incorporated into every TB programme with the goal of improving TB control in immigrant groups. They also suggested that this could be extended to other infectious diseases such as HIV.</p> <p>Source of funding NR</p>	<p>Limitation identified by review team Comparison in this study is public health nurse alone, and limited details were described. Whether this is a valid comparator for the UK is unclear. The comparator was also undertaken pre-2003.</p> <p>It was unclear if any other service delivery changes occurred during this period which could have accounted for improvements in contact tracing between the comparator and intervention period. There were, however, differences in the population characteristics between the comparator and intervention period.</p> <p>This study is likely to only be transferable to settings with a high proportion of immigrants from TB endemic areas who do not speak the native country language and where the proportion of contacts traced is sub-optimal with current practice.</p>
