## Health Technology Evaluation

### Encorafenib with binimetinib for treating BRAF V600E mutation-positive advanced non-small-cell lung cancer [ID6177]

#### Final scope

#### Remit/evaluation objective

To appraise the clinical and cost effectiveness of encorafenib with binimetinib within its marketing authorisation for treating BRAF V600E mutation-positive advanced non-small-cell lung cancer (NSCLC).

#### Background

Lung cancer is the third most common cancer and the most common cause of cancer death in the UK, accounting for 10% of all new cancer cases and 20% of all cancer deaths in 2020.<sup>1</sup> There were around 37,000 new lung cancer cases and 27,000 deaths from lung cancer in England in 2020.<sup>1</sup> Most lung cancers are diagnosed at an advanced stage, when the cancer has spread to lymph nodes and other organs in the chest (locally advanced disease; stage 3) or to other parts of the body (metastatic disease; stage 4).<sup>2</sup> In 2021, 91% (around 31,000) of people diagnosed with lung cancer in England had NSCLC.<sup>2</sup>

BRAF is a protein which is part of a signalling pathway which helps to regulate cell proliferation, differentiation and death. Between 1-5% of people with NSCLC are estimated to have a mutation in the BRAF gene. A third to half of mutations in the BRAF gene are called BRAF V600 mutations with the majority of these being specifically BRAF V600E.<sup>3,4</sup>

Current clinical management for advanced or metastatic (stage 3 or 4) NSCLC typically aims to control the cancer for as long as possible and help with symptoms. The treatment pathway for NSCLC can be divided into interconnected decision points based on the number staging system and line of therapy. Treatment choices are influenced by the presence of biological markers (including programmed cell death 1 ligand PD-L1 status), oncogenic driver genetic alterations, histology (squamous or non-squamous) and previous treatment.

For untreated advanced NSCLC with a BRAF V600 mutation, NICE guidance recommends dabrafenib with trametinib as a first-line treatment ([TA898](#)). For previously treated NSCLC NICE guidance recommends nivolumab ([TA655](#) and [TA713](#)), atezolizumab ([TA520](#)) and pembrolizumab ([TA428](#)) monotherapies as well as docetaxel with nintedanib ([TA347](#)). Docetaxel alone and platinum doublet chemotherapy may also be offered.

#### The technology

Encorafenib (Braftovi, Pierre-Fabre) with binimetinib (Mektovi, Pierre-Fabre) does not currently have a marketing authorisation in the UK for BRAF V600E positive NSCLC. It is being studied in single arm trials in adults with BRAF V600 mutation positive non-small cell lung cancer.

Encorafenib with binimetinib has a marketing authorisation for treatment of unresectable or metastatic melanoma with a BRAF V600 mutation.

<b>Intervention(s)</b>	Encorafenib with binimetinib
<b>Population(s)</b>	People with advanced NSCLC that is positive for a BRAF V600E mutation
<b>Subgroups</b>	<p>If the evidence allows the following subgroups will be considered:</p> <ul style="list-style-type: none"> <li>• line of therapy (treated or untreated)</li> <li>• histology (squamous or non-squamous)</li> <li>• PD-L1 expression</li> </ul>
<b>Comparators</b>	<p>For people with untreated advanced NSCLC</p> <ul style="list-style-type: none"> <li>• Dabrafenib with trametinib</li> <li>• Pembrolizumab with platinum doublet chemotherapy (cisplatin or carboplatin with either gemcitabine, vinorelbine, docetaxel or pemetrexed)</li> <li>• Pembrolizumab monotherapy</li> <li>• Atezolizumab as monotherapy or in combination with bevacizumab and chemotherapy</li> <li>• Platinum doublet chemotherapy</li> </ul> <p>For people with previously treated advanced NSCLC</p> <ul style="list-style-type: none"> <li>• Atezolizumab monotherapy</li> <li>• Pembrolizumab monotherapy</li> <li>• Nivolumab monotherapy</li> <li>• Docetaxel with nintedanib</li> <li>• Docetaxel</li> <li>• Platinum doublet chemotherapy</li> <li>• Best-supportive care</li> </ul>

<p><b>Outcomes</b></p>	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none"> <li>• overall survival</li> <li>• progression-free survival</li> <li>• response rate</li> <li>• time to treatment discontinuation</li> <li>• time to subsequent therapy</li> <li>• adverse effects of treatment</li> <li>• health-related quality of life</li> </ul>
<p><b>Economic analysis</b></p>	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p> <p>The availability of any commercial arrangements for the intervention, comparator and subsequent treatment technologies will be taken into account.</p> <p>The availability and cost of biosimilar and generic products should be taken into account.</p>
<p><b>Other considerations</b></p>	<p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>
