Health Technology Evaluation

Fruquintinib for previously treated metastatic colorectal cancer

Final scope

Draft remit/evaluation objective

To appraise the clinical and cost effectiveness of fruquintinib within its marketing authorisation for treating metastatic colorectal cancer.

Background

Colorectal cancer is a malignant tumour arising from the lining of the large intestine (colon and rectum). Metastatic colorectal cancer refers to disease that has spread beyond the large intestine and nearby lymph nodes. This type of cancer often first spreads to the liver, but metastases may also occur in other parts of the body, including the lungs, brain and bones. Most colorectal cancers are adenocarcinomas, these start in glands that line the insides of the colon and rectum.

There are around 42,900 new cases of colorectal cancer each year in the UK, accounting for 11% of all cancers.¹ Around 4 in 10 (43%) new cases of colorectal cancer in the UK were in people aged over 75 years, but it can affect young people too¹.

Metastatic colorectal cancer treatment aims to prolong survival and improve quality of life. Treatment can involve a combination of surgery (to resect the primary tumour or the metastases), chemotherapy (to make the tumour or metastases resectable, or to manage the cancer), biological therapy, and radiotherapy. For people with untreated metastatic colorectal cancer:

- [NICE technology appraisal 61](#) recommends intravenous fluorouracil/folinic acid (5-FU/FA) or capecitabine.
- [NICE guideline 151](#) recommends either folinic acid plus fluorouracil plus oxaliplatin (FOLFOX) or capecitabine plus oxaliplatin (CAPOX).
- [NICE technology appraisal 439](#) recommends cetuximab for people with EGFR-expressing, RAS wild-type metastatic disease, and panitumumab for people with RAS wild-type metastatic disease.
- [NICE technology appraisal 709](#) recommends pembrolizumab for people with high microsatellite instability or mismatch repair deficiency.

For people with previously treated metastatic colorectal cancer:

- [NICE guideline 151](#) recommends folinic acid plus fluorouracil plus irinotecan (FOLFIRI), after either FOLFOX or CAPOX, or single-agent irinotecan (after FOLFOX) or raltitrexed (for patients with advanced colorectal cancer who are intolerant to 5-FU/FA, or for whom these drugs are not suitable).
- [NICE technology appraisal 405](#) recommends trifluridine–tipiracil, and [NICE technology appraisal 866](#) recommends regorafenib, if fluoropyrimidine-, oxaliplatin- or irinotecan-based chemotherapies, anti-vascular endothelial growth factor (VEGF) agents and anti-EGFR agents have failed or when these therapies are not suitable.

Final scope for the evaluation of fruquintinib for previously treated metastatic colorectal cancer

Issue Date: November 2023

- [NICE technology appraisal TA716 recommends](#) nivolumab with ipilimumab as a treatment for those with high microsatellite instability or mismatch repair deficiency after fluoropyrimidine-based combination chemotherapy.
- [NICE technology appraisal TA668 recommends](#) encorafenib plus cetuximab as a treatment option for those with BRAF V600E mutation-positive metastatic colorectal cancer who have had previous systemic treatment.

If standard therapies are unsuccessful, not tolerated or contraindicated, people are treated with best supportive care to manage the symptoms and complications of the condition.

The technology

Fruquintinib (Takeda) does not currently have a marketing authorisation in the UK for the treatment of adults with metastatic colorectal cancer. It has been studied in clinical trials compared with best supportive care in adults with advanced, metastatic colorectal cancer who had progressed after second line or above standard chemotherapy and those who have progressed on, or were intolerant to chemotherapy, anti-VEGF and anti-EGFR biologics, and TAS-102 (trifluridine-tipiracil) or regorafenib.

Intervention(s)	Fruquintinib
Population(s)	People with metastatic colorectal cancer (mCRC) who have had two or more previous treatments
Comparators	<ul style="list-style-type: none"> • Trifluridine-tipiracil monotherapy • Regorafenib • Best supportive care
Outcomes	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none"> • overall survival • progression-free survival • response rates • adverse effects of treatment • health-related quality of life

<p>Economic analysis</p>	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>If the technology is likely to provide similar or greater health benefits at similar or lower cost than technologies recommended in published NICE technology appraisal guidance for the same indication, a cost comparison may be carried out.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p> <p>The availability of any commercial arrangements for the intervention, comparator and subsequent treatment technologies will be taken into account.</p>
<p>Other considerations</p>	<p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>
