

IP1062/2 Chemosaturation via percutaneous hepatic artery perfusion and hepatic vein isolation for primary or metastatic liver cancer

SNOMED CT provides clinical terms for entry into the patient record to record clinical information relevant to that encounter; the mandated classifications (OPCS-4 or ICD-10) provide a method to collect and aggregate data to allow accurate and consistent data analysis.

Procedure and device:

SNOMED CT preferred term (concept ID)

Fluoroscopy guided percutaneous chemosaturation of hepatic artery (737083005)

OPCS-4.9

J16.1 Localised perfusion of liver

Y53.- Approach to organ under image control or Y68.- Other approach to organ under image control

OR

Y79.- Approach to organ through artery

Y73.2 Extracorporeal circulation NEC

X70-X71 Procurement of drugs for neoplasm (Bands 1-10)

(Depending on the cytotoxic drug used)

Note: Codes in category **Y53 Approach to organ under image control** and **Y68 Other approach to organ under image control** are used as additional codes for to identify the method of image control. The codes in these categories include but are not limited to procedures performed under image control using a percutaneous approach.

When a procedure has been performed using image control and the code that classifies the procedure **does not** state the type of image control used, then a code from these categories **must be** assigned. If the specific method of image control is not stated, the fourth-character **.9** must be assigned.

Diagnosis or health condition:

SNOMED CT preferred term (concept ID)

Primary malignant neoplasm of liver (95214007)

Secondary malignant neoplasm of liver (94381002)

ICD-10 code(s):

C22.- Malignant neoplasm of liver and intrahepatic bile ducts

Or

C78.7 Secondary malignant neoplasm of liver and intrahepatic bile duct

Clinical coding recommendations for NICE guidance

For each published interventional procedure and medical technologies guidance, we work with NHS Digital to provide relevant clinical coding information.

SNOMED CT provides clinical terms for entry into the patient record to store clinical information relevant to that encounter.

The mandated classifications (OPCS-4 or ICD-10) provide a method to collect and aggregate data to allow accurate and consistent data analysis.

NICE and NHS Digital Information Representation Services work collaboratively to ensure the most appropriate SNOMED CT, OPCS-4 and ICD codes are provided.

NHS Digital is the national release centre for the UK edition of SNOMED CT, ICD and OPCS-4. Further SNOMED CT information including licensing, see [here](#). Further Classifications information, see [here](#).
