Com . no.	Consultee name and organisation	Sec. no.	Comments	Response
7	Consultee 1 Company Olympus Medical	2.4	<p>Suggest change from "...Insertion and removal of the device are both done as day-case procedures..." to "...Insertion and removal of the device are both done as day-case or outpatient procedures..."</p> <p>Chughtai, 2021 demonstrated that the device can be conducted in patients under sedation or local anaesthesia in an ambulatory or outpatient setting.</p> <p>All procedures were performed in an outpatient setting (De Nunzio, 2020).</p>	<p>Please respond to all comments</p> <p>Thank you for your comment.</p> <p>Section 2.4 has been changed to note that removal of the device is done as a day-case or outpatient procedure.</p> <p>Amparore 2021, which includes UK data, states 'The device is implanted under direct vision through a standard rigid 19F-22F cystoscope under light intravenous sedation and removed in outpatient setting through an open-ended 22F Foley catheter with topical anaesthesia.' This detail has been added to the overview.</p>
8	Consultee 1 Company Olympus Medical	3.2	<p>Suggest addition of "preservation of sexual function" as a key safety/ or efficacy outcome.</p> <p>Preservation of ejaculatory function is of major importance to men when pursuing treatments for LUTS secondary to BPH. TURP is associated with rates of retrograde ejaculation of 38.2-89.0% and impotence rates of 13.0-14.0%, while laser prostatectomy has retrograde ejaculation rates of 50-76.6% and impotence rates of 5.2-7.9%. Both surgical and pharmacologic sexual side effects contribute to the undertreatment of men with BPH. One major advantage of prostatic urethral temporary implant insertion procedure is the preservation of sexual function.</p> <p>Chughtai, 2021 demonstrated that subjects with the device, did not</p>	<p>Thank you for your comment.</p> <p>Section 3.2 has been changed to include preservation of sexual function as a key efficacy outcome.</p>

Com . no.	Consultee name and organisation	Sec. no.	Comments	Response
			<p>experience de novo erectile dysfunction or retrograde ejaculation.</p> <p>A prospective study, also showed sexual function was preserved in all device subjects at 6 months (Nunzio, 2020).</p> <p>One professional expert also highlighted "...impact on SHIM (Sexual Health Inventory for Men) ..." as a key efficacy/ safety outcome (Question 15 of the Specialist Advice Questionnaire).</p>	Please respond to all comments
9	Consultee 1 Company Olympus Medical	3.3	<p>Suggest removal of 'urinary incontinence' as a key safety outcome.</p> <p>Urinary incontinence – if occurring – would be reported as an adverse event.</p> <p>1 case of transient incontinence due to device displacement (3.1%) (Porpiglia, 2018).</p> <p>6 patients (8.4%) observed transient incontinence which resolved after device removal (Nunzio, 2021).</p> <p>It's important to highlight that they were TRANSIENT and self-resolving (I.e., not urinary incontinence).</p> <p>De Nunzio, 2021 demonstrated that urinary continence was preserved in all 70 subjects, using validated questionnaires (incontinence Symptom Index questionnaire (ISI)).</p> <p>No cases of urinary or transient incontinence were reported in Chughtai, 2021 and Amparore, 2020.</p> <p>Important to highlight that one expert highlighted that - to their knowledge - "...there have been no incidences of incontinence..." (Question 14 of specialist advice questionnaires).</p>	<p>Thank you for your comment.</p> <p>Section 3.3 has been changed to remove 'urinary incontinence' from the key safety outcomes.</p>

Com . no.	Consultee name and organisation	Sec. no.	Comments	Response
10	Consultee 1 Company Olympus Medical	3.5	<p>It's worth highlighting the below for context.</p> <p>Chughtai, 2021 demonstrated a powerful placebo effect that resulted in non-statistically significant improvement in prostatic urethral temporary implant versus the sham arm at the time of unblinding at 3 months.</p> <p>A meta-analysis found significant improvements in AUA-SS (American Urology Association Symptom Score) and Qmax at 3 months in the sham arm of randomized controlled trials in BPH trials [1]. AUA-SS improved an average of 27%, similar to the improvement in IPSS of 28.9% in the prostatic urethral temporary implant sham arm. Whilst the sham effect is large, this improvement is similar to Prostatic Urethral Lift (PULs) sham arm improvement of 24.2% [2] and Rezum's sham arm improvement of 20% [3].</p> <p>1. C Welliver, M Kottwitz, P Feustel, K. McVary Clinically and Statistically Significant Changes Seen in Sham Surgery Arms of Randomized, Controlled Benign Prostatic Hyperplasia Surgery J. Urol, 194 (2015), pp. 1682-1687 doi.org/10.1016/j.juro.2015.06.091</p> <p>2 - CG Roehrborn, SN Gange, ND Shore, et al. (2013). The prostatic urethral lift for the treatment of lower urinary tract symptoms associated with prostate enlargement due to benign prostatic hyperplasia: the L.I.F.T. Study. J Urol, 190 (6) (2013), pp. 2161-2167, 10.1016/j.juro.2013.05.116.</p> <p>3 - KT McVary, T Rogers, CG. Roehrborn Rezūm Water Vapor Thermal Therapy for Lower Urinary Tract Symptoms Associated With Benign Prostatic Hyperplasia: 4-Year Results from Randomized Controlled Study Urology, 126 (2019), pp. 171-179, 10.1016/j.urology.2018.12.041</p>	<p>Please respond to all comments</p> <p>Thank you for your comment.</p> <p>Section 3.5 of the draft guidance states: 'The committee noted that there:</p> <ul style="list-style-type: none"> • is only 1 device for this procedure and the technology is evolving • was a sizeable placebo effect associated with the procedure in some of the studies.' <p>The committee considered the evidence for prostatic urethral temporary implant insertion and noted there was a sizeable placebo effect in the randomised controlled trial by Chughtai et al.,2021.</p> <p>The IP programme does not assess the efficacy and safety of comparator interventions.</p>

Com . no.	Consultee name and organisation	Sec. no.	Comments	Response
11	Consultee 1 Company Olympus Medical	3.5	There was a powerful placebo effect in one study (Chughtai, 2021). Suggest change from "...was a sizeable placebo effect associated with the procedure in some of the studies..." to "...was a sizeable placebo effect associated with the procedure in one study...".	Please respond to all comments Thank you for your comment. Section 3.5 has been changed as suggested.
12	Consultee 1 Company Olympus Medical	3.6	Suggest addition of "...those looking to preserve sexual function..." as people who may benefit from this procedure. Preservation of ejaculatory function is of major importance to men when pursuing treatments for LUTS secondary to BPH. One major advantage of prostatic urethral temporary implant is the preservation of sexual function. No prostatic urethral temporary implant subjects experienced de novo erectile dysfunction or retrograde ejaculation (Chughtai, 2020). This is similar to a prospective study showing sexual function was preserved in all prostatic urethral temporary implant subjects at 6 months of follow-up (De Nunzio, 2020). A professional expert highlighted that a group of patients who would particularly benefit from this procedure are those "...seeking a treatment alternative to both medication and standard resecting procedures such a TURP or laser, with the desire to avoid negative impact upon sexual function and ensure a rapid return to normal activities...".	Thank you for your comment. A committee comment has been added to note that preservation of sexual function may be a benefit of the procedure.
13	Consultee 1 Company Olympus Medical	Overview – efficacy summary	Suggest inclusion of the Amparore, 2021 as most relevant and informative. In the single-arm trial of 81 patients, from baseline to 24 months 5 (6.2%) patients required drug therapy. No additional patients underwent alternative treatments (either medical or surgical) between 24 and 36 months (Amparore, 2021).	Thank you for your comment. The following text from Amparore 2021 has been added to the overview: 'From baseline to 24 months, 5 (6.2%) patients needed drug therapy and 8 (8.6%) patients

Com . no.	Consultee name and organisation	Sec. no.	Comments	Response
				Please respond to all comments
14	Consultee 1 Company Olympus Medical	Overview – safety summary	<p>The phrasing of the overall safety summary is misrepresentative of the published evidence and reads ambiguously.</p> <p>Suggested summary:</p> <p>In the prostatic urethral temporary implant group, there was only a total of 5 procedure- and/or device-related SAEs observed in 3 patients. Only 3 SAEs were found to be possibly related to the device. Most AEs were mild, anticipated, and all but 2 resolved within 1-4 weeks. In addition, all procedures were performed without serious perioperative AEs. The author concludes that AEs were limited to mild events at a low rate (Chughtai, 2021).</p> <p>No intraoperative complications were reported, and all patients were discharged without a catheter on the same day of the procedure. The rate of post-operative adverse events was low, with all complications grade as I or II according to the Clavien-Dindo system, self-limiting and resolved within 30 days. No new procedure or device related adverse events were reported as any of the other follow-up points out to 3 years (Amparore, 2021).</p> <p>Overall, 75 complications were detected in 70 patients. All complications except for one, were graded as I or II according to the Clavien-Dindo system and were self-limiting, with 75% of patients recovering from all their AEs within 7 days (De Nunzio, 2020).</p>	<p>Thank you for your comment.</p> <p>The ‘Overall’ paragraph at the beginning of the safety section was intended to describe the overall rate of adverse events reported in Chughtai 2021 as ‘serious adverse events’ and ‘all adverse events’. It was not intended to be an overall summary of safety events reported by the different studies.</p> <p>The title of this paragraph has been changed to ‘unspecified adverse events’. Chughtai 2021 was the only paper that reported a general rate of adverse events without specifying what they all were. Adverse events in the other studies are described under the relevant subheading.</p>

Com . no.	Consultee name and organisation	Sec. no.	Comments	Response
15	Consultee 1 Company Olympus Medical	Overview – p9	<p>Suggest change from “...Urinary incontinence because of device displacement...” to “... Transient incontinence because of device displacement...”</p> <p>1 case of transient incontinence due to device displacement (3.1%) (Porpiglia, 2018).</p> <p>It’s important to highlight that they were TRANSIENT and self-resolving (i.e., not urinary incontinence).</p>	<p>Thank you for your comment.</p> <p>This adverse event has been described as it was described in the paper. The next sentence states that it resolved after the device was removed on day 1 after insertion.</p>
16	Consultee 1 Company Olympus Medical	Overview – p10	<p>Suggested inclusion of Chughtai, 2021, Porpiglia, 2018 and De Nunzio, 2020.</p> <p>Retreatment (at 12 months): 10% (12/118)</p> <p>- 6 men (4.7%) had an alternative BPH surgery during the 12-month follow up due to deterioration of symptoms [prostatic urethral temporary implant insertion did not complicate any of the alternative surgeries].</p> <p>- 6 men (4.7%) required medication for LUTS secondary to BPH (Chughtai, 2021)</p> <p>Retreatment: 0% (0/70)</p> <p>- No patients required reintervention at 6 months (De Nunzio, 2021).</p> <p>Retreatment: 9% (3/32)</p> <p>- No patients required adjunctive surgical treatments during the 3-year follow-up period.</p> <p>- Whilst all patients discontinued BPH-related medical therapy after the</p>	<p>Thank you for your comment.</p> <p>Additional details on reinterventions have been added to safety summary of the overview.</p> <p>The need for medication is described in the efficacy section of the overview.</p>
