

Barrett's oesophagus

3.1a Evidence review for different endoscopic and radiological staging techniques

NICE guideline <number>

*Evidence reviews underpinning recommendations 1.4.1 to 1.4.4
in the NICE guideline*

August 2022

Draft for consultation

*These evidence reviews were developed
by Guideline Development Team NGC*

Disclaimer

The recommendations in this guideline represent the view of NICE, arrived at after careful consideration of the evidence available. When exercising their judgement, professionals are expected to take this guideline fully into account, alongside the individual needs, preferences and values of their patients or service users. The recommendations in this guideline are not mandatory and the guideline does not override the responsibility of healthcare professionals to make decisions appropriate to the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian.

Local commissioners and/or providers have a responsibility to enable the guideline to be applied when individual health professionals and their patients or service users wish to use it. They should do so in the context of local and national priorities for funding and developing services, and in light of their duties to have due regard to the need to eliminate unlawful discrimination, to advance equality of opportunity and to reduce health inequalities. Nothing in this guideline should be interpreted in a way that would be inconsistent with compliance with those duties.

NICE guidelines cover health and care in England. Decisions on how they apply in other UK countries are made by ministers in the [Welsh Government](#), [Scottish Government](#), and [Northern Ireland Executive](#). All NICE guidance is subject to regular review and may be updated or withdrawn.

1. The diagnostic accuracy of different endoscopic and radiological staging techniques

1.1. Review question

For adults with suspected stage 1 adenocarcinoma, what is the diagnostic accuracy of different endoscopic and radiological staging techniques?

1.1.1. Introduction

Staging of suspected stage 1 oesophageal adenocarcinoma is an important step in the management pathway which allows doctors and patients to decide upon the best treatment option. Although the risk of lymph node metastases in stage 1 tumours is low, that risk increases as the tumour invades the submucosa (T1b). Endoscopic resection facilitates gold-standard pathological tumour staging. Radiological staging (cross-sectional imaging and endoscopic ultrasound) can be used for both tumour and nodal staging. This evidence review evaluates the diagnostic accuracy of endoscopic and radiological staging in stage 1 oesophageal adenocarcinoma.

1.1.2. Summary of the protocol

For full details see the review protocol in Appendix A.

Table 1: PICO characteristics of review question

Population	Adults, 18 years and over, with suspected stage 1 adenocarcinoma including those with high grade dysplasia only on biopsies Exclusion: Adults with non-dysplastic Barrett's oesophagus, low grade dysplasia and those with suspected stages higher than stage 1 adenocarcinoma
Target condition	Barrett's Oesophagus with stage 1 adenocarcinoma
Index tests	Endoscopic staging techniques: <ul style="list-style-type: none">• high resolution endoscopy with biopsies• Chromoendoscopy (e.g. narrow band imaging) Radiological staging techniques <ul style="list-style-type: none">• EUS (endoscopic ultrasound, including mini probes)• CT• CT PET
Reference standard	Comparison to final clinical staging (non- imaging) endoscopic resection or surgical resection
Outcomes	Tumour or Node or Metastasis staging (or all) <ul style="list-style-type: none">• Sensitivity• Specificity• Data to calculate 2x2 tables to calculate sensitivity and specificity (number of true positives, true negatives, false positives and false negatives)
Study design	Observational studies: <ul style="list-style-type: none">• Cross-sectional studies• Prospective / Retrospective diagnostic cohort studies

- Systematic Reviews of observational studies
Any study containing a diagnostic accuracy data or analysis

1

2 **1.1.3. Methods and process**

3 This evidence review was developed using the methods and process described in
4 [Developing NICE guidelines: the manual](#). Methods specific to this review question are
5 described in the review protocol in appendix A and the methods document.

6 Declarations of interest were recorded according to [NICE's conflicts of interest policy](#).

7 **1.1.4. Diagnostic evidence**

8 **1.1.4.1. Included studies**

9 Five studies were included in the review.^{1, 3-6} These are summarised in Table 2 below.
10 Evidence from these studies is summarised in the clinical evidence summary below in Table
11 3.

12 Three studies looked at the diagnostic accuracy of the EUS, looking at slightly different
13 outcomes (stages of cancer) and including different populations (in terms of cancer stage
14 and high-grade dysplasia). Thus, findings from these studies have not been meta-analysed
15 but have been reported separately. One retrospective cohort study looked at the diagnostic
16 accuracy of EUS for detecting T1a (vs T1b, T2-4) staging, and N staging compared with
17 histopathology in people with oesophageal cancer. One further retrospective study looked at
18 the diagnostic accuracy of EUS for detecting T1b (vs Tcis/T1a, T2, T3) in people with high-
19 grade dysplasia or intramucosal carcinoma. One study looked at the diagnostic accuracy of
20 the EUS for detecting T1b (vs T0, T1a) and N staging in people with high-grade dysplasia or
21 intramucosal carcinoma.

22 One prospective cohort study looked at the diagnostic accuracy of mini-probe EUS and CT
23 for T(T1a vs T1b) and N staging compared with histology based on endoscopic or surgical
24 resection.

25 One prospective randomised cross-over study looked at the diagnostic accuracy of High
26 frequency mini-probes (HFPS) and conventional radial endoscopic ultrasonography (crEUS)
27 for T (T1a vs T1b) and N staging compared with histology based on endoscopic or surgical
28 resection.

29 The committee set clinical decision thresholds as sensitivity/specificity =0.9 and 0.8 above
30 which a test would be recommended and 0.6 and 0.5 below which a test is of no clinical use.
31 Sensitivity was prioritised for decision making as the committee agreed not missing the
32 detection of cancer or metastasis was the most important factor to consider and under-
33 staging can have adverse consequences for patients.

34 No relevant diagnostic test accuracy studies of endoscopic staging techniques were
35 identified.

36 See also the study selection flow chart in Appendix C, sensitivity and specificity forest plots in
37 Appendix E, and study evidence tables in Appendix D.

38 **1.1.4.2. Excluded studies**

39 See the excluded studies list in Appendix G.

1 **1.1.5. Summary of studies included in the diagnostic evidence**

2 **Table 2: Summary of studies included in the evidence review**

Study	Population	Target condition	Index test	Reference standard	Comments
Cen 2008 ¹	Oesophageal cancer patients (N=87; n=81 with adenocarcinoma, n=6 squamous cell carcinoma) Median age: 65 years USA	T1 staging (T1a vs T1b, T2-4) Metastasis/N staging (N0 vs N1)	EUS	Histopathologic assessment of resected specimens	Retrospective study Indirectness: N=22 had cancer above stage 1 but it is not clear if this was suspected from baseline. N=6 had squamous cell carcinoma
Pech 2006 ⁴	Patients with confirmed 'early' cancer in Barrett's oesophagus (n=100) Median age (range): 64 (58-72) years The T category was assessed using high frequency probes (HFPs) in 66/100 patients who had elevated and/or depressed lesions. EUS with HFPs was not carried out on endoscopically unequivocal mucosal neoplasia (type IIb lesions in the Paris classification) Germany	T (T1m vs T1sm) and N staging Staging using the Paris classification T1m assumed to correspond to T1a T1sm assumed to correspond to T1b	(Miniprobe) EUS (upper gastrointestinal endoscopy) CT (of the chest and upper abdomen, and abdominal ultrasonography)	Histology (based on endoscopic resection or surgical specimens)	Patients in whom carcinoma could not be confirmed by experienced gastroenterological pathologists were excluded Includes people with T2 (n=4) and T3(n=3) histology; data for EUS calculated including those with T1m and T1sm staging based on EUS and Histology (n=55), excluding T2 and T3 2x2 table for N staging and T staging for CT could not be calculated from the paper.
Pech 2010 ³	Patients with suspected 'early' cancer in Barrett's oesophagus,	T staging (mucosal and submucosal Barrett's	High frequency mini-probes (HFPs)	Histology (based on endoscopic resection or	Prospective randomised cross-over study

Study	Population	Target condition	Index test	Reference standard	Comments
	referred for endoscopic treatment for Barrett's cancer (n=43) Median age (range): 66 (58-73) Germany	cancer i.e. T1m vs T1sm) N staging (N1, N0)	Conventional radial endoscopic ultrasonography (crEUS)	surgical specimens)	Includes people with macroscopic tumour type: I-III; with histological stage T1m1-4 and T1sm1-3 2x2 table only calculated for N staging
Scotiniotis 2001 ⁵	Patients with Barrett's oesophagus and high-grade dysplasia or intramucosal carcinoma based on endoscopy, endoscopic biopsies, and CT. N=22 Mean age (SD) 64 (8.7) years USA	T staging (T1b vs Tcis/T1a, T2, T3)	EUS	Surgical/pathologic evaluation	Retrospective study Indirectness: n=4 had cancer at stages T2 and T3 N staging results not included in the present review as 3/5 people classified as positive of lymph node metastasis by the EUS had stage beyond T1 (T2/3) and therefore the majority of people for which sensitivity results were based did not meet the review protocol.
Thomas 2010 ⁶	Patients with histologically proven high-grade intraepithelial neoplasia or intramucosal carcinoma (n=50) Median age (range): 69 (60-79) years UK	T staging (; T1sm vs T0 and T1m) N staging (N1 vs N0)	EUS	Histology	Retrospective study Pre-EUS histology based on 1 to 2 esophagogastric endoscopies and 2 to 36 mucosal biopsies (median 12): n=31 (62%) high-grade dysplasia, n=10 (38%) intramucosal carcinoma

1 See Appendix D for full evidence tables

1 **1.1.6. Summary of the diagnostic evidence**

2 The assessment of the evidence quality was conducted with emphasis on sensitivity as the
3 committee agreed not missing the detection of cancer or metastasis was the most important
4 factor to consider and under-staging can have detrimental consequences. The committee set
5 clinical decision thresholds as sensitivity/specificity =0.9 and 0.8 above which a test would be
6 recommended and 0.6 and 0.5 below which a test is of no clinical use.

7

Table 3: Clinical evidence summary: diagnostic test accuracy for radiological staging techniques

Studies	N	Risk of bias	Inconsistency	Indirectness	Imprecision	Effect size (95%CI)	Quality
CT to detect T1 tumours in people with 'early' cancer in Barrett's oesophagus							
1 prospective cohort study	66	Serious ¹	Not serious	Serious ²	Cannot be assessed ³	Sensitivity=1.00	VERY LOW
		Serious ¹	Not serious	Serious ²	Cannot be assessed ³	Specificity=0.00	VERY LOW
Mini-probe EUS to detect T1a vs T1b ('T1m vs T1sm') in people with 'early' cancer in Barrett's oesophagus							
1 prospective cohort study	55	Serious ¹	Not serious	Serious ²	Serious ⁴	Sensitivity= 0.89 (0.75 -0.96)	VERY LOW
		Serious ¹	Not serious	Serious ²	Serious ⁴	Specificity= 0.27 (0.06 -0.61)	VERY LOW
CT to detect N staging in people with 'early' cancer in Barrett's oesophagus							
1 prospective cohort study	66	Serious ¹	Not serious	Serious ²	Cannot be assessed ³	Sensitivity= 0.38	VERY LOW
		Serious ¹	Not serious	Serious ²	Cannot be assessed ³	Specificity=1.00	VERY LOW
Mini-probe EUS to detect N staging in people with 'early' cancer in Barrett's oesophagus							
1 prospective cohort study	66	Serious ¹	Not serious	Serious ²	Cannot be assessed ³	Sensitivity= 0.75	VERY LOW
		Serious ¹	Not serious	Serious ²	Cannot be assessed ³	Specificity= 0.97	VERY LOW
HFPs for T1a ('pT1m') in people with suspected 'early' cancer in Barrett's oesophagus							
1 prospective randomised cross-over study	36	Serious ¹	Not serious	Serious ²	Serious ⁴	Sensitivity= 0.70 (0.46 -0.87)	VERY LOW
	36	Serious ¹	Not serious	Serious ²	Very serious ⁴	Specificity= 0.69 (0.41- 0.88)	VERY LOW
HFPs for T1b ('pT1sm') in people with suspected 'early' cancer in Barrett's oesophagus							
1 prospective randomised cross-over study	36	Serious ¹	Not serious	Serious ²	Serious ⁴	Sensitivity= 0.69 (0.41 -0.88)	VERY LOW
		Serious ¹	Not serious	Serious ²	Serious ⁴	Specificity= 0.75 (0.50 -0.90)	VERY LOW
crEUS for T1a ('pT1m') in people with suspected 'early' cancer in Barrett's oesophagus							
1 prospective randomised cross-over study	25	Serious ¹	Not serious	Serious ²	Very serious ⁴	Sensitivity= 0.73 (0.39 -0.93)	VERY LOW
		Serious ¹	Not serious	Serious ²	Very serious ⁴	Specificity= 0.78 (0.49- 0.94)	VERY LOW

Studies	N	Risk of bias	Inconsistency	Indirectness	Imprecision	Effect size (95%CI)	Quality
crEUS for T1b ('pT1sm') in people with suspected 'early' cancer in Barrett's oesophagus							
1 prospective randomised cross-over study	25	Serious ¹	Not serious	Serious ²	Serious ⁴	Sensitivity= 0.64 (0.36- 0.86)	VERY LOW
		Serious ¹	Not serious	Serious ²	Very serious ⁴	Specificity= 0.73 (0.39- 0.93)	VERY LOW
crEUS for N1 status in people with suspected 'early' cancer in Barrett's oesophagus							
1 prospective randomised cross-over study	16	Serious ¹	Not serious	Serious ²	Very serious ⁴	Sensitivity= 1.00 (0.29- 1.00)	VERY LOW
		Serious ¹	Not serious	Serious ²	Serious ⁴	Specificity= 0.92 (0.64- 1.00)	VERY LOW
EUS for T1a (vs T1b, T2-4) in people with oesophageal cancer							
1 retrospective cohort study	87	Serious ¹	Not serious	Very serious ²	Serious ⁴	Sensitivity= 0.67 (0.50- 0.80)	VERY LOW
		Serious ¹	Not serious	Very serious ²	Serious ⁴	Specificity= 0.93 (0.82- 0.99)	VERY LOW
EUS for N1 (vs N0) in people with oesophageal cancer							
1 retrospective cohort study	87	Serious ¹	Not serious	Very serious ²	Serious ⁴	Sensitivity= 0.38 (0.18- 0.62)	VERY LOW
		Serious ¹	Not serious	Very serious ²	Not serious	Specificity= 0.94 (0.85- 0.98)	VERY LOW
EUS for T1b (vs T0, T1a) in people with high-grade intraepithelial neoplasia or intramucosal carcinoma							
1 retrospective series	46	Very serious ¹	Not serious	Not serious	Serious ⁴	Sensitivity= 0.56 (0.31- 0.78)	VERY LOW
		Very serious ¹	Not serious	Not serious	Serious ⁴	Specificity: 0.93 (0.76- 0.99)	VERY LOW
EUS for N1 status in people with high-grade intraepithelial neoplasia or intramucosal carcinoma							
1 retrospective series	29	Very serious ¹	Not serious	Not serious	Very serious ⁴	Sensitivity= 0.50 (0.01- 0.99)	VERY LOW
		Very serious ¹	Not serious	Not serious	Serious ⁴	Specificity= 0.96 (0.81- 1.00)	VERY LOW
EUS for T1b (Tcis/T1a, T2, T3) in people with high-grade dysplasia or intramucosal carcinoma							
1 retrospective cohort study	22	Serious ¹	Not serious	Serious ²	Serious ⁴	Sensitivity: 1.00 (0.48- 1.00)	VERY LOW
		Serious ¹	Not serious	Serious ²	Serious ⁴	Specificity: 0.94 (0.71- 1.00)	VERY LOW

¹ Risk of bias was assessed using the QUADAS-2 checklist. The evidence was downgraded by 1 increment if the studies were rated at serious risk of bias and downgraded by 2 increments if the studies were rated at very serious risk of bias.

² Evidence was downgraded by 1 increment due to serious concerns over population indirectness or by 2 increments due to very serious concerns over population indirectness.

³ Where the study does not report confidence intervals or the data to calculate 2x2 tables imprecision cannot be assessed. Where this is the case evidence quality was downgraded by 1 increment.

⁴ Imprecision was assessed based on inspection of the confidence intervals. For sensitivity, two clinical decision thresholds were determined at the value above which a test would be recommended (90%), and a second below which a test would be considered of no clinical use (60%). For specificity, two clinical decision thresholds were determined

at the value above which a test would be recommended (80%), and a second below which a test would be considered of no clinical use (50%). The evidence was downgraded by 1 increment when the range of the confidence interval around the point estimate crossed one threshold and downgraded by 2 increments when the range covered two thresholds.

5

6 2.1.9. The committee's discussion and interpretation of the evidence

7 2.1.9.1. The outcomes that matter most

8 Diagnostic review

9 The committee considered the diagnostic measures of sensitivity and specificity of the
10 staging techniques. Sensitivity was prioritised for decision making as the committee agreed
11 not missing the detection of cancer or metastasis was the most important factor to consider
12 and under-staging can have adverse consequences for patients.

13 Clinical decision thresholds were set by the committee as sensitivity of 0.9 and specificity of
14 0.8 above which a test would be recommended, and sensitivity of 0.6 and specificity of 0.5
15 below which a test is of no clinical use. The committee agreed that the default values of 0.9
16 and 0.8 that are widely used for decision making across clinical guidelines were also
17 applicable to people with Barrett's oesophagus.

18 Diagnostic RCT review/ Intervention review

19 The committee considered the outcomes of health-related quality of life, progression to
20 higher stage of cancer, mortality, adverse events (including staging perforation, bleeding,
21 pain, allergic reaction to contrast and complications of oesophagectomy). For purposes of
22 decision making, all outcomes were considered equally important and were therefore rated
23 as critical by the committee. No evidence was identified for any of the outcomes.

24 2.1.9.2. The quality of the evidence

25 Diagnostic review

26 Clinical evidence for the diagnostic accuracy of radiological staging techniques was available
27 from 5 studies. One prospective cohort study on the diagnostic accuracy of mini-probe
28 endoscopic ultrasound (EUS) and CT for T (T1a vs T1b) and N staging. One prospective
29 randomised cross-over study for the diagnostic accuracy of high frequency mini-probe
30 (HFPs) and conventional radial endoscopic ultrasonography (crEUS) for T (T1a vs T1b) and
31 N staging.

1 Three further studies looked at the diagnostic accuracy of the EUS, for differentiating
2 between different stages of cancer in slightly different populations. Hence, findings from
3 studies on the EUS were not meta-analysed and were reviewed separately. One
4 retrospective cohort study looked at the diagnostic accuracy of EUS for detecting T1a (vs
5 T1b, T2-4) staging, and N staging in people with oesophageal cancer. One further
6 retrospective study looked at the diagnostic accuracy of EUS for detecting T1b (vs Tcis/T1a,
7 T2, T3) in people with high-grade dysplasia or intramucosal carcinoma. One study looked at
8 the diagnostic accuracy of the EUS for detecting T1b (vs T0, T1a) and N staging in people
9 with high-grade dysplasia or intramucosal carcinoma.

10 Evidence for both sensitivity and specificity across the different techniques and studies was
11 of very low quality, downgraded due to concerns over risk of bias. This was often due to lack
12 of sufficient detail on participant exclusion, and due to lack of clarity on the interpretation of
13 the index test results without knowledge of the reference standard results. Evidence was
14 further downgraded for population indirectness (due to the studies including people with
15 confirmed 'early' carcinoma and being unclear if a stage higher than 1 was suspected, or due
16 to the inclusion of a small number of people with stage higher than 1) and imprecision in the
17 effect estimates.

18 No clinical evidence was identified on the diagnostic accuracy of endoscopic staging
19 techniques.

20 Intervention review/ Diagnostic RCT

21 No relevant clinical evidence was identified. Studies were commonly excluded because they
22 were done in a population that did not match the review protocol, such as people with
23 oesophageal cancer higher than stage 1, people with non-dysplastic Barrett's oesophagus,
24 squamous cell carcinoma or cancer not related to Barrett's oesophagus, or because no
25 outcomes meeting the review protocol were reported.

26 **2.1.9.3. Benefits and harms**

27 The committee agreed based on their clinical experience that the diagnostic accuracy of CT
28 is very low for detecting stage 1 oesophageal adenocarcinoma because of the resolution of
29 the technique, due to the small size of T1 oesophageal adenocarcinoma. Evidence showed
30 CT had a high specificity (1.00) but a very low sensitivity (0.38) for N staging. The committee
31 noted the evidence illustrating the poor diagnostic value of CT as a staging technique was in
32 line with their experience and reflected the reason why CT should not be used before
33 endoscopic resection for suspected T1 oesophageal adenocarcinoma.

34 Evidence for the accuracy of mini-probe EUS in detecting T1a s T1b tumours showed a high
35 sensitivity (0.89) almost reaching the clinical threshold of 0.9, but a low specificity (0.27) that
36 did not reach the threshold of 0.8. The committee noted mini-probe EUS performed well in
37 detecting T1a but not T1b tumours. The diagnostic accuracy of the mini-probe EUS for N
38 staging was higher with a sensitivity of 0.75 and a specificity 0.97 that exceeded the clinical
39 threshold.

40 The diagnostic accuracy of the crEUS for distinguishing T1a (vs T1b) tumours and T1b (vs
41 T1a) in people with early cancer was moderately high with both measures of sensitivity and
42 specificity ranging between 0.64-0.78, but not high enough to reach the agreed thresholds for
43 decision making. However, the diagnostic accuracy for detecting N1 status was very high
44 with sensitivity (1.00) and specificity (0.92) both exceeding clinical thresholds set for decision
45 making. EUS had a similar sensitivity (0.67) for distinguishing T1a vs T1b, T2-T4. It was
46 noted that this evidence was partially indirect due to inclusion of a small number of people
47 with cancer stage higher than 1. For distinguishing T1b from T0, T1a, in people with high-
48 grade dysplasia or cancer, EUS had a sensitivity of 0.56 that was in line with evidence from
49 populations not including high-grade dysplasia and also did not reach the decision-making
50 threshold.

1 For distinguishing T1b from Tcis, T1a, T2 or T3, EUS has a sensitivity of 1.00 and also a very
2 high specificity of 0.94. The committee confirmed based on their clinical experience that EUS
3 can be useful in people with suspected T1b based on endoscopic appearances but noted
4 that the current result was based on only 5 cases with T1b, there was imprecision in the
5 effect estimate and the population was partially indirect due to the inclusion of a small
6 number of people with T2 and T3 in the analysis. The committee noted that in current
7 practice, EUS is routinely used for suspected T1b tumours or higher but considering the
8 current evidence base, agreed not to make any recommendation for EUS in T staging
9 people with suspected T1b. There was consensus that EUS should also not be used before
10 resection for staging T1a oesophageal adenocarcinoma, as the risk of lymph node
11 metastasis is negligible.

12 Based on the evidence and their clinical experience they emphasised that EUS is not reliable
13 in differentiating T1a with T1b tumours but may be useful to detect lymph node metastasis in
14 patients with confirmed T1b tumours based on histological examination of endoscopic
15 resection specimens and people with suspected T1b tumours based on endoscopic
16 appearances. They agreed EUS should be considered in these populations as they have a
17 high risk of lymph node metastasis, emphasising that the risk would be indicated by the
18 endoscopic resection, and may benefit from additional oncological treatment such as
19 radiotherapy alone or in combination with chemotherapy. Based on their clinical experience
20 the committee also noted that PET, CT and the EUS can all over-stage tumours, but EUS is
21 likely to provide pathological confirmation for the presence of lymph nodes.

22 Evidence indicated the diagnostic accuracy of HFPs to detect T1a and T1b tumours to be
23 relatively high with sensitivity 0.70 and 0.69 and specificity 0.69 and 0.75 respectively, but
24 not meeting clinical thresholds for decision making. The committee noted the diagnostic
25 accuracy of HFPs and the crEUS are shown to be similar, indicating HFPs do not have any
26 additional benefit to crEUS. This was not in line with their experience as they would expect
27 the accuracy of HFPs to be higher, but as the evidence came from one small study, they
28 could not be confident in the results reported.

29 In absence of evidence on endoscopic staging techniques, the committee used their clinical
30 experience to make consensus recommendations. They agreed that endoscopic resection is
31 the most accurate staging technique and in current practice is the accepted gold standard. It
32 is also recommended by the British Society of Gastroenterology guidelines on Barrett's
33 oesophagus. They agreed that endoscopic resection should be offered to people with
34 suspected stage 1 oesophageal adenocarcinoma.

35 **2.1.9.4. Cost effectiveness and resource use**

36 Accurate staging is important for determining prognosis and planning appropriate treatment
37 in people with suspected stage 1 oesophageal adenocarcinoma. Imaging techniques and
38 endoscopic resection can both be utilised for this purpose. Imaging tests are less invasive
39 than endoscopic procedures. Average procedure costs were presented to the committee.

40 No economic evaluations were identified for this review question.

41 The committee discussed the clinical evidence and agreed that endoscopic resection should
42 be offered for staging in suspected cases of stage 1 oesophageal adenocarcinoma since the
43 evidence suggested that it is more accurate than the alternatives.

44 While EUS and CT were both cheaper, the committee concurred, based on the evidence and
45 their clinical experience that the resolution on a CT scan is not clear enough to detect stage
46 1 adenocarcinoma while EUS does not differentiate between T1a and T1b tumours. The
47 committee therefore considered their use to be an unnecessary use of NHS resources and
48 they recommended to not offer CT for staging suspected T1 adenocarcinoma or EUS for
49 staging of suspected stage T1a oesophageal adenocarcinoma prior to endoscopic resection
50 staging.

1 Finally, for people with suspected or confirmed T1b oesophageal adenocarcinoma, they
2 agreed that EUS should be considered since it could confirm the presence of pathological
3 lymph nodes. The evidence suggested that there is no indication for a CT to be performed in
4 this situation.

5 In the absence of any evidence, the committee refrained from making any recommendations
6 for PET-CT.

7 These recommendations are in line with current practice and are therefore unlikely to have a
8 substantial impact on NHS resources.

9 **2.1.10. Recommendations supported by this evidence review**

10 This evidence review supports recommendations 1.4.1, 1.4.2, 1.4.3 and 1.4.4

2 Appendix A – Review protocols

A31 Review protocol for diagnostic accuracy of endoscopic and radiological staging techniques

ID	Field	Content
0.	PROSPERO registration number	CRD42022308179
1.	Review title	The diagnostic accuracy of different endoscopic and radiological staging techniques
2.	Review question	For adults with suspected stage 1 carcinoma, what is the diagnostic accuracy of different endoscopic and radiological staging techniques?
3.	Objective	To determine how different techniques for staging (endoscopic and radiological) affects the accuracy of the investigations for suspected stage 1 carcinoma
4.	Searches	<p>The following databases (from inception) will be searched:</p> <ul style="list-style-type: none"> • Cochrane Central Register of Controlled Trials (CENTRAL) • Cochrane Database of Systematic Reviews (CDSR) • Embase • MEDLINE • Epistemonikus <p>Searches will be restricted by:</p> <ul style="list-style-type: none"> • English language studies • Human studies • Letters and comments are excluded

		<p>Other searches:</p> <ul style="list-style-type: none"> • Inclusion lists of systematic reviews will be checked by the reviewers <p>The searches may be re-run 6 weeks before the final committee meeting and further studies retrieved for inclusion if relevant.</p> <p>The full search strategies will be published in the final review.</p> <p>Medline search strategy to be quality assured using the PRESS evidence-based checklist (see methods chapter for full details).</p>
5.	Condition or domain being studied	Barrett's Oesophagus with suspected stage 1 adenocarcinoma
6.	Population	<p>Inclusion:</p> <p>Adults, 18 years and over, with suspected stage 1 adenocarcinoma including those with high grade dysplasia only on biopsies</p> <p>Exclusion: Adults with non-dysplastic Barrett's oesophagus, low grade dysplasia and those with suspected stages higher than stage 1 adenocarcinoma</p>
7.	Test	<ul style="list-style-type: none"> • endoscopic staging techniques <ul style="list-style-type: none"> ○ high resolution endoscopy with biopsies

		<ul style="list-style-type: none"> ○ Chromoendoscopy (e.g. narrow band imaging) ● radiological staging techniques <ul style="list-style-type: none"> ○ EUS (endoscopic ultrasound, including mini probes) ○ CT ○ CT PET
8.	Reference standard	<ul style="list-style-type: none"> ● Comparison to final clinical staging (non- imaging) endoscopic resection or surgical resection
9.	Types of study to be included	<p>Observational studies:</p> <ul style="list-style-type: none"> ● Cross-sectional studies ● Prospective / Retrospective diagnostic cohort studies ● Systematic Reviews of observational studies ● Any study containing a diagnostic accuracy data or analysis
10.	Other exclusion criteria	<p>Studies that do not report sensitivity and specificity, or insufficient data to derive these values.</p> <p>Non-English language studies.</p> <p>Non comparative cohort studies</p> <p>Before and after studies</p> <p>Conference abstracts will be excluded as it is expected there will be sufficient full text published studies available.</p>
11.	Context	<p>In people with suspected stage 1 adenocarcinoma, different endoscopic and radiological techniques are used for staging. This review aims to determine the diagnostic accuracy of those different staging techniques</p>
12.	Primary outcomes (critical outcomes)	<p>All outcomes are considered equally important for decision making and therefore have all been rated as critical:</p> <p>Tumour or Node or Metastasis staging (or all)</p>

		<ul style="list-style-type: none"> • Sensitivity • Specificity • Data to calculate 2x2 tables to calculate sensitivity and specificity (number of true positives, true negatives, false positives and false negatives)
14.	Data extraction (selection and coding)	<p>All references identified by the searches and from other sources will be uploaded into EPPI reviewer and de-duplicated.</p> <p>This review will make use of the priority screening functionality within the EPPI-reviewer software.</p> <p>10% of the abstracts will be reviewed by two reviewers, with any disagreements resolved by discussion or, if necessary, a third independent reviewer.</p> <p>The full text of potentially eligible studies will be retrieved and will be assessed in line with the criteria outlined above.</p> <p>A standardised form will be used to extract data from studies (see Developing NICE guidelines: the manual section 6.4).</p> <p>10% of all evidence reviews are quality assured by a senior research fellow. This includes checking:</p> <ul style="list-style-type: none"> • papers were included /excluded appropriately • a sample of the data extractions • correct methods are used to synthesise data • a sample of the risk of bias assessments <p>Disagreements between the review authors over the risk of bias in particular studies will be resolved by discussion, with involvement of a third review author where necessary.</p> <p>Study investigators may be contacted for missing data where time and resources allow.</p>
15.	Risk of bias (quality) assessment	Risk of bias quality assessment will be assessed using QUADAS-2 checklist
16.	Strategy for data synthesis	Where available, outcome data from new studies will be meta-analysed.

		<p>Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5). Fixed-effects (Mantel-Haenszel) techniques will be used to calculate risk ratios for the binary outcomes where possible. Continuous outcomes will be analysed using an inverse variance method for pooling weighted mean differences.</p> <p>Heterogeneity between the studies in effect measures will be assessed using the I² statistic and visually inspected. An I² value greater than 50% will be considered indicative of substantial heterogeneity. Sensitivity analyses will be conducted based on pre-specified subgroups using stratified meta-analysis to explore the heterogeneity in effect estimates. If this does not explain the heterogeneity, the results will be presented pooled using random-effects.</p> <p>GRADEpro will be used to assess the quality of evidence for each outcome, taking into account individual study quality and the meta-analysis results. The 4 main quality elements (risk of bias, indirectness, inconsistency and imprecision) will be appraised for each outcome. Publication bias is tested for when there are more than 5 studies for an outcome.</p> <p>The risk of bias across all available evidence was evaluated for each outcome using an adaptation of the ‘Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox’ developed by the international GRADE working group http://www.gradeworkinggroup.org/</p> <p>Where meta-analysis is not possible, data will be presented, and quality assessed individually per outcome.</p> <p>If sufficient data is available, WinBUGS will be used for network meta-analysis, if possible, given the data identified.</p>
17.	Analysis of sub-groups	<p>Stratification:</p> <p>Individual radiological techniques vs gold standard</p> <p>EUS techniques (standard EUS OR miniprobe vs gold standard)</p> <p>Endoscopic techniques (electronic chromoendoscopy OR dye endoscopy vs gold standard)</p> <p>Subgrouping:</p>

		If serious or very serious heterogeneity (I2>50%) is present, sub-grouping will occur according to the following strategies: electronic chromoendoscopy

26.	Funding sources/sponsor	This systematic review is being completed by the National Guideline Centre which receives funding from NICE.
27.	Conflicts of interest	All guideline committee members and anyone who has direct input into NICE guidelines (including the evidence review team and expert witnesses) must declare any potential conflicts of interest in line with NICE's code of practice for declaring and dealing with conflicts of interest. Any relevant interests, or changes to interests, will also be declared publicly at the start of each guideline committee meeting. Before each meeting, any potential conflicts of interest will be considered by the guideline committee Chair and a senior member of the development team. Any decisions to exclude a person from all or part of a meeting will be documented. Any changes to a member's declaration of interests will be recorded in the minutes of the meeting. Declarations of interests will be published with the final guideline.
28.	Collaborators	Development of this systematic review will be overseen by an advisory committee who will use the review to inform the development of evidence-based recommendations in line with section 3 of Developing NICE guidelines: the manual . Members of the guideline committee are available on the NICE website: [NICE guideline webpage] .
29.	Other registration details	
30.	Reference/URL for published protocol	
31.	Dissemination plans	NICE may use a range of different methods to raise awareness of the guideline. These include standard approaches such as: <ul style="list-style-type: none"> • notifying registered stakeholders of publication • publicising the guideline through NICE's newsletter and alerts • issuing a press release or briefing as appropriate, posting news articles on the NICE website, using social media channels, and publicising the guideline within NICE.

A12 Health economic review protocol

Review question	All questions – health economic evidence
Objectives	To identify health economic studies relevant to any of the review questions.
Search criteria	<ul style="list-style-type: none"> • Populations, interventions and comparators must be as specified in the clinical review protocol above. • Studies must be of a relevant health economic study design (cost–utility analysis, cost-effectiveness analysis, cost–benefit analysis, cost–consequences analysis, comparative cost analysis). • Studies must not be a letter, editorial or commentary, or a review of health economic evaluations. (Recent reviews will be ordered although not reviewed. The bibliographies will be checked for relevant studies, which will then be ordered.) • Unpublished reports will not be considered unless submitted as part of a call for evidence. • Studies must be in English.
Search strategy	A health economic study search will be undertaken for all years using population-specific terms and a health economic study filter – see appendix B below.
Review strategy	<p>Studies not meeting any of the search criteria above will be excluded. Studies published before 2006, abstract-only studies and studies from non-OECD countries or the USA will also be excluded.</p> <p>Studies published in 2006 or later, that were included in the previous guidelines, will be reassessed for inclusion and may be included or selectively excluded based on their relevance to the questions covered in this update and whether more applicable evidence is also identified.</p> <p>Each remaining study will be assessed for applicability and methodological limitations using the NICE economic evaluation checklist which can be found in appendix H of Developing NICE guidelines: the manual (2014).²</p> <p>Inclusion and exclusion criteria</p> <ul style="list-style-type: none"> • If a study is rated as both ‘Directly applicable’ and with ‘Minor limitations’ then it will be included in the guideline. A health economic evidence table will be completed and it will be included in the health economic evidence profile. • If a study is rated as either ‘Not applicable’ or with ‘Very serious limitations’ then it will usually be excluded from the guideline. If it is excluded then a health economic evidence table will not be completed and it will not be included in the health economic evidence profile. • If a study is rated as ‘Partially applicable’, with ‘Potentially serious limitations’ or both then there is discretion over whether it should be included.

Where there is discretion

The health economist will make a decision based on the relative applicability and quality of the available evidence for that question, in discussion with the guideline committee if required. The ultimate aim is to include health economic studies that are helpful for decision-making in the context of the guideline and the current NHS setting. If several studies are considered of sufficiently high applicability and methodological quality that they could all be included, then the health economist, in discussion with the committee if required, may decide to include only the most applicable studies and to selectively exclude the remaining studies. All studies excluded on the basis of applicability or methodological limitations will be listed with explanation in the excluded health economic studies appendix below.

The health economist will be guided by the following hierarchies.

Setting:

- UK NHS (most applicable).
- OECD countries with predominantly public health insurance systems (for example, France, Germany, Sweden).
- OECD countries with predominantly private health insurance systems (for example, Switzerland).
- Studies set in non-OECD countries or in the USA will be excluded before being assessed for applicability and methodological limitations.

Health economic study type:

- Cost–utility analysis (most applicable).
- Other type of full economic evaluation (cost–benefit analysis, cost-effectiveness analysis, cost–consequences analysis).
- Comparative cost analysis.
- Non-comparative cost analyses including cost-of-illness studies will be excluded before being assessed for applicability and methodological limitations.

Year of analysis:

- The more recent the study, the more applicable it will be.
- Studies published in 2006 or later (including any such studies included in the previous guidelines) but that depend on unit costs and resource data entirely or predominantly from before 2006 will be rated as 'Not applicable'.
- Studies published before 2006 (including any such studies included in the previous guidelines) will be excluded before being assessed for applicability and methodological limitations.

Quality and relevance of effectiveness data used in the health economic analysis:

- The more closely the clinical effectiveness data used in the health economic analysis match with the outcomes of the studies included in the clinical review the more useful the analysis will be for decision-making in the guideline.

Appendix B – Literature search strategies

The literature searches for this review are detailed below and complied with the methodology outlined in Developing NICE guidelines: the manual.²

For more information, please see the Methodology review published as part of the accompanying documents for this guideline.

B.1 Clinical search literature search strategy

Searches were constructed using a PICO framework where population (P) terms were combined with Intervention (I) and in some cases Comparison (C) terms. Outcomes (O) are rarely used in search strategies as these concepts may not be indexed or described in the title or abstract and are therefore difficult to retrieve. Search filters were applied to the search where appropriate.

Table 7: Database parameters, filters and limits applied

Database	Dates searched	Search filter used
Medline (OVID)	1946 – 28 April 2022	Randomised controlled trials Systematic review studies Observational studies Diagnostic tests studies Exclusions (animal studies, letters, comments, editorials, case studies/reports) English language

B.2 Health Economics literature search strategy

Health economic evidence was identified by conducting searches using terms for a broad Barrett's Oesophagus population. The following databases were searched: NHS Economic Evaluation Database (NHS EED - this ceased to be updated after 31st March 2015), Health Technology Assessment database (HTA - this ceased to be updated from 31st March 2018) and The International Network of Agencies for Health Technology Assessment (INAHTA). Searches for recent evidence were run on Medline and Embase from 2014 onwards for health economics, and all years for quality-of-life studies.

Table 8: Database parameters, filters and limits applied

Database	Dates searched	Search filters and limits applied
Medline (OVID)	Health Economics 1 January 2014 – 29 April 2022	Health economics studies Quality of life studies
	Quality of Life 1946 – 29 April 2022	Exclusions (animal studies, letters, comments, editorials, case studies/reports)
		English language
Embase (OVID)	Health Economics 1 January 2014 – 29 April 2022	Health economics studies Quality of life studies

Database	Dates searched	Search filters and limits applied
	Quality of Life 1974 – 29 April 2022	Exclusions (animal studies, letters, comments, editorials, case studies/reports, conference abstracts) English language
NHS Economic Evaluation Database (NHS EED) (Centre for Research and Dissemination - CRD)	Inception – 31 st March 2015	
Health Technology Assessment Database (HTA) (Centre for Research and Dissemination – CRD)	Inception – 31 st March 2018	
The International Network of Agencies for Health Technology Assessment (INAHTA)	Inception - 29 April 2022	English language

Study type	Retrospective study
Study methodology	Data source: All patients who had pre-treatment staging with EUS and underwent oesophagectomy as primary therapy for oesophageal cancer between 1999 and 2006, from the Thoracic and Cardiovascular Surgery Oesophageal database at the University of Texas M.D. Anderson Cancer Centre (MDACC) Recruitment: consecutive
Number of patients	n = 87 (n=81 had adenocarcinoma; n=6 had squamous cell carcinoma)
Patient characteristics	Age, median: 65 years Gender (male to female ratio): 69/18 Ethnicity: not specified Setting: Thoracic and Cardiovascular Surgery Oesophageal database at the University of Texas M.D. Anderson Cancer Centre (MDACC) Country: USA Inclusion criteria: Patients with a diagnosis of carcinoma of the oesophagus or the gastroesophageal junction; EUS preoperative staging, primary esophagectomy, and with availability of a postoperative pathology specimen for reanalyses. Exclusion criteria: pre-operative chemotherapy or radiation therapy or the presence of distant metastatic disease Other characteristics: Pathologic T classification: T1a= 42; T1b=23; T2=8; T3=12; T4=2
Target condition(s)	T staging (T1 cancer) and lymph node metastasis

Reference	Cen 2008¹				
Index test(s) and reference standard	<p><u>Index test: EUS</u> EUS examination was performed using a radial scanning endoscope (Olympus GF-UM130, GF-UM160; Olympus America, Melville, NY or Pentax EG-3830U, EG-3630UR; Pentax, Tokyo, Japan), a linear array endoscope (Olympus/Aloka GF-UC-130, GF-UC-160P; Aloka Medical Device, Tokyo, Japan or Pentax FG32UA, FG36UX; Pentax Precision Instruments, Orangeburg, NY), an EUS probe (Olympus UM-2R, UM-3R), or a combination of these with a frequency range of 5.0 to 20 mega-hertz. EUS-guided fine-needle aspirations were performed using a 22-gauge or 25-gauge needle (Echo-1-22 needle; Wilson-Cook, Winston-Salem, NC). Reports of those examinations were reviewed and the following information was collected: tumor size, depth of tumor invasion (EUST classification), and the presence or absence of either enlarged lymph nodes or lymph nodes with abnormal echo-genicity (N0/N1 status). The full length of the oesophagus, the stomach, and the celiac axis were scanned endosonographically. Lymph nodes were classified as positive (N1) if they exhibited at least 2 of the following criteria: dimension > 1cm, around shape with discrete margins, and hypoechoic texture Spiral CT scans of the chest and abdomen were obtained to exclude the possibility of distant metastases. Positron emission tomography (PET) scans were performed when available. 504 CANCER February 1, 2008 / Volume 112 / Number 3</p> <p><u>Reference standard: Histopathologic assessment of resected specimens</u> Patients underwent subtotal oesophagectomy and/or proximal gastrectomy and lymph node dissection with curative intent. Specimens from the resections were processed according to a standardized protocol. All resected lymph nodes were evaluated for cancer metastases. Reports of those findings were reviewed, and the following data obtained: size, extension, and location of the tumour; LVI status (re-evaluated); degree of differentiation; presence of Barrett mucosa; presence or absence of lymph node metastasis; and histologic type (squamous cell carcinoma or adenocarcinoma). All cancers were staged by both EUS and in the surgical specimen according to the TNM staging system of the American Joint Committee on Cancer/International Union Against Cancer (AJCC/UICC). 19, 20 T1 cancers were subclassified into 2 groups based on depth of invasion: T1a (intramucosal) or T1b (sub-mucosal-infiltrating into the submucosa without invasion of the muscularis propria).</p> <p>Time between measurement of index test and reference standard: not specified</p>

Statistical measures	<p><u>Index test EUS for T1 (vs T2-4); (n=87)</u> Sensitivity: 0.91 (95% CI 0.81- 0.97) Specificity: 0.91 (95% CI 0.71, 0.99)</p> <p><u>Index test EUS for T1a (vs T1b, T2-4); (n=87)</u> Sensitivity: 0.67 (95% CI 0.50- 0.80) Specificity: 0.93 (95% CI 0.82- 0.99)</p> <p><u>Index test: EUS for N1 status (n=87)</u> Sensitivity: 0.38 (95% CI 0.18, 0.62) Specificity: 0.94 (95% CI 0.85, 0.98)</p>			
Source of funding	Supported in part by the Dallas, cantu, Smith,and Park Families the Rivercreek Foundation.			
Limitations	Risk of bias: serious risk of bias due to lack of sufficient detail on assessment of index test and reference standard results, flow and timing. Indirectness: very serious population indirectness with the study including people with histology higher than stage 1 (n=22; 25%) but it being unclear if this was suspected before the EUS and histopathology assessment and n=6 people with squamous cell carcinoma.			
Comments				

Reference	Pech 2006 ⁴
Study type	Prospective cohort
Study methodology	Data source: Patients with suspected early cancer in Barrett's oesophagus referred for endoscopic therapy at the Teaching Hospital, University of Mainz between October 1999 and October 2001 Recruitment: Consecutive
Number of patients	n = 100; n=66 analysed (and n=55 included in the analysis for this review; see details on 2x2 table section below)
Patient characteristics	Age, median (range): 64 years (58-72)

Reference	Pech 2006 ⁴
Target condition(s)	<p>Gender (male to female ratio): 80/20</p> <p>Ethnicity: not specified</p> <p>Setting: University hospital</p> <p>Country: Germany</p> <p>Inclusion criteria: Patients referred to the Teaching Hospital, University of Mainz between October 1999 and October 2001 with suspicion of early cancer in Barrett's oesophagus that were screened with high-resolution video endoscopy and chromoendoscopy with methylene blue or acetic acid staining, or both. Consecutive patients with confirmed early cancer in Barrett's oesophagus. Only patients without prior CT for staging, performed by the referring physicians were included</p> <p>High resolution video endoscopy and chromoendoscopy with methylene blue or acetic acid staining, or both was carried out using Fujinon Europe, Inc., Willich, Germany).</p> <p>Biopsies were taken from all observed lesions, as well as four-quadrant biopsies every 1-2cm over the entire Barrett's segment. Assessment of biopsies taken during the diagnostic procedures was usually carried out by at least two different gastroenterological pathologists. The histological criteria, classification and assessment of the grade of differentiation corresponded to the WHO classification</p> <p>Exclusion criteria: Patients in whom carcinoma could not be confirmed by experienced gastroenterological pathologists.</p> <p>Characteristics: Short segment/Long segment Barrett's oesophagus: 47/53</p>
Index test(s) and reference standard	<p>T staging (T1m and T1sm) and N staging</p> <p><u>Index test: (Miniprobe) EUS</u> All patients with proven cancer underwent intensive staging, using EUS with 7.5-MHz probes (Olympus UM, 7.5 MHz; Olympus Deutschland Ltd., Hamburg, Germany) and if elevated lesions were found, 12.5-MHz or 20-MHz HFPs (Fujinon VSP501) were used as well</p> <p><u>Index test: CT</u> Helical CT of the chest and upper abdominal organs was carried out in all patients (TwinFlash; two-row helical CT, Elscint Ltd., Wiesbaden, Germany). Only patients without prior CT for staging, performed by the referring physicians were included. At least two radiologists were involved in reading the CT scan. All patients also received an abdominal ultrasound examination (Logiq 5 and Logiq 7; General Electrics, Fairfield, CT) to detect intraabdominal lesions.</p> <p>Depending on the appearance of the lymph nodes detected with CT and/or EUS, patients were assigned to three different categories: category 1: patients without any suspicious lymph nodes</p>

Reference	Pech 2006 ⁴				
	<p>category 2: patients with mediastinal or celiac lymph nodes >1 cm in size or lymph nodes <1 cm at the tumour level without suspicious EUS characteristics</p> <p>category 3: patients with lymph nodes <1 cm at the tumour level or round and hypoechoic lymph nodes with sharp margins on EUS, independent of size and location.</p> <p>The accuracy of EUS was based on a threshold of group 3.</p> <p><u>Reference standard: Histology</u> Based on endoscopic resection or surgical specimens. The results of T staging were compared with the pathological T category (pTx). For lymph node staging, lymph nodes were considered as non-malignant when the pathological assessment was negative or the long-term follow-up showed no progression.</p> <p>The T category was assessed using HFPs in 66 of the 100 patients who had elevated and/or depressed lesions. EUS with HFPs was not carried out on endoscopically unequivocal mucosal neoplasia (type IIb lesions in the Paris classification)</p> <p>Time between measurement of index test and reference standard: unclear</p>				
2x2 table		Reference standard +	Reference standard -	Total	EUS for T1m (mucosal carcinoma) vs T1sm (submucosal carcinoma) ; calculated including only people with T1m and T1sm on EUS and histology (n=55); excluding those with T2 (n=4) and T3(n=3) histology. T1m assumed to correspond to T1a T1sm assumed to correspond to T1b

	Specificity: 1.00
Source of funding	None
Limitations	Risk of bias: Serious risk of bias due to flow and timing (analysis based on 66/100 people who had HFPs) lack of clarity over the interpretation of the index test results without knowledge of the reference standard results and it being unclear for which participants reference standard was endoscopic or surgical. Indirectness: Serious population indirectness with the study including people with confirmed 'early' carcinoma and being it unclear if a stage higher than 1 was suspected (at least 7 of which had higher than stage 1 on histology)
Comments	

Reference	Pech 2010 ³
Study type	Prospective randomised cross-over study
Study methodology	Data source: Patients referred for endoscopic treatment for Barrett's cancer between 2006 and 2007 Recruitment: consecutive
Number of patients	n = 43
Patient characteristics	Age, median (range): 66 (58-73) years Gender (male to female ratio): 34/9 Ethnicity: not specified Setting: Department of Internal Medicine, HSK Wiesbaden, Wiesbaden, Germany Country: Germany

Reference	Pech 2010³
	<p>Inclusion criteria: all patients with suspected early cancer in Barrett's oesophagus who were referred for endoscopic treatment. Patients were screened by high-resolution video endoscopy with acetic acid staining (Fujinon EG-450HR or EG-450WR5 instruments; Fujinon Europe, Inc. Willich, Germany)</p> <p>Exclusion criteria: not specified</p>
Target condition(s)	T staging (mucosal and submucosal cancer)
Index test(s) and reference standard	<p>Participants were randomised to either HFPs or crEUS as the initial diagnostic method; afterwards all patients were re-examined with the alternative procedure by the same endosonographer. All examinations were performed by two experienced endosonographers with experience averaging more than 1000 EUS procedures in total and more than 200 oesophageal cancer staging procedures each per year.</p> <p>One day before EUS staging, upper endoscopy was performed by an experienced endoscopist who was not the endosonographer for the same patient. The assessment of macroscopic tumour type was performed prospectively at the first endoscopy performed in the hospital's medical department using the Japanese classification (since 2003, the Paris classification), which divides superficial neoplastic lesions into the following gross types: polypoid (type I), flat and slightly elevated (IIa), flat and level (IIb), flat depressed (IIc) and ulcerated (III). Biopsies were taken from all lesions seen, as were four-quadrant biopsies every 1-2cm over the entire Barrett's segment. The histological criteria, classification, and assessment of differentiation grade corresponded to the WHO classification. Patients with HGIN or type IIb lesions were excluded from this study because recent analysis demonstrated that this macroscopic type is almost never associated with submucosal invasion.</p> <p><u>Index test: High- frequency mini-probes (HFPs)</u> 20-MHz HFPs (Fujinon SP 501; Fujinon Europe). HFPs were used after instillation of water into the oesophageal lumen and suctioning of luminal air. Infiltration depth and lymph node status were assessed.</p> <p><u>Index test: Conventional radial endoscopic ultrasonography (crEUS)</u> crEUS (Pentax EG-3630; 7.5-10 MHz; Pentax, Tokyo, Japan, with Hitachi EUB 6500, Hitachi Medical Systems GmbH, Wiesbaden, Germany). Infiltration depth and lymph node status were assessed.</p> <p>T and N staging was carried out using standard EUS criteria based on the TNM classification system. Mucosal cancer was defined as a hypoechoic thickening of the mucosal layer (second layer on EUS). Submucosal infiltration was defined as hypoechoic invasion or loss of the fourth layer using the 20 MHz HFPs and of the third layer using crEUS with 10 MHz. The frequency of the crEUS was then changed to 7.5 MHz to assess lymph node status. Criteria for malignant lymph nodes were: size 10mm or greater; round shape; hypoechoic pattern; clear visible borders.</p> <p><u>Reference standard: Histology (from endoscopic resection or surgical specimens)</u></p>

Reference	Pech 2010 ³				
	<p>The results of the T staging were compared with the pathological T category (pTX). Only patients with histologically proven T stage were included in the analysis. Patients with suspected mucosal Barrett's cancer or Barrett's cancer with submucosal infiltration without suspect lymph nodes underwent (diagnostic) endoscopic resection using the 'such-and-cut' technique with a ligation device. The ligation device was reusable EuroLigator (WMT Inc., Wiesbaden, Germany). The resected specimens and histopathological assessments were processed by highly experienced pathologists.</p> <p>All patients who were treated endoscopically were included in a follow-up protocol. Those patients with a suspected tumour staged T2 or higher and/or suspect lymph nodes were scheduled to undergo oesophageal resection. The results of the EUS assessments were compared with the histopathological findings after oesophageal resection.</p> <p>Time between measurement of index test and reference standard: 1 day</p>

Source of funding	Not specified
Limitations	Risk of bias: serious risk of bias due to lack of sufficient detail on patient selection (exclusion criteria not specified) Indirectness: serious population indirectness with the study including people with suspected 'early' carcinoma and being it unclear if a stage higher than 1 was suspected (information in the paper suggests T2 was suspected for some but it is unclear at which stage during the study)
Comments	

Reference	Scotiniotis 2001⁵
Study type	Retrospective study
Study methodology	Data source: EUS database established in 1993. Recruitment: not specified; people from database meeting inclusion criteria
Number of patients	n = 22
Patient characteristics	Age, mean (SD): 64 (8.7) years Gender (male to female ratio): 20/2 Ethnicity: not specified Setting: not specified Country: USA Inclusion criteria: Patients with Barrett's oesophagus and high-grade dysplasia or intramucosal carcinoma based on endoscopy, endoscopic biopsies and CT who underwent EUS between November 1993 and January 2000; who went oesophagectomy with surgical pathology available for comparison with EUS findings. Exclusion criteria: people who did not undergo surgery or whose endoscopic biopsy specimens obtained at the time of EUS demonstrated submucosal invasion (stage T1b) Other characteristics: mean length of Barrett's epithelium (SD; range): 7 (2.6- 2.11) cm

Reference	Scotiniotis 2001⁵				
Target condition(s)	T staging (T1b vs Tcis/T1a ,T2,T3)				
Index test(s) and reference standard	<p><u>Index test: EUS</u> EUS was performed with the patient under conscious sedation with a mechanical sector scanning echoendoscope system (GF-UM20, Olympus America, Inc., Melville, N.Y.). The procedures were performed by 2 experienced endosonographers (G.G.G., M.L.K.). Images were obtained at 7.5 MHz and 12 MHz. Because all patients had HGD or ImCa on endoscopic biopsy, the determination that a lesion was superficial was based on preservation of the integrity of the submucosal layer as demonstrated by its endosonographic characteristics. Therefore, absence of disruption of the hyperechoic, third sonographic layer, or the interface between the second and third layers, beneath the lesion was interpreted as no submucosal invasion. Lesions with these findings were accorded stage Tcis/T1a rather than Tx or T0 because of the known HGD or ImCa on biopsy. Submucosal invasion (T1b) was diagnosed when there was hypoechoic disruption of the interface between the second and third sonographic layers and focal hypoechoic blurring or thickening of the third layer. Focal hypoechoic wall layer disruption extending into but not through the fourth hypoechoic layer indicated invasion into the muscularis propria (T2), and extending through the fourth sonographic layer indicated invasion into the adventitia and periesophageal tissue (T3).</p> <p>Staging of lymph nodes was complete in all cases. Lymph nodes were assessed along the length of the oesophagus and in the proximal gastric and celiac regions. For staging purposes, lymph nodes were classified as positive (N1) if they exhibited 2 of the following criteria: were greater than 1 cm in diameter, round with discrete margins, and/or hypoechoic. Lymph nodes were considered as not containing malignancy (N0) if they were small, isoechoic or hyperechoic, had a non-discrete margin, and were not round in shape.</p> <p><u>Reference standard: Histopathologic evaluation</u> A single GI pathologist (E.E.F.) reviewed all endoscopic biopsy and esophagectomy specimens. Tissue was fixed in formalin, and sections were examined after staining with H&E. The diagnosis of Barrett’s epithelium was established by the presence of specialized columnar epithelium in esophageal biopsy specimens. HGD arising in Barrett’s epithelium was diagnosed by using an established classification scheme.²⁸ ImCa (stage T1a) was defined as carcinoma cells extending beyond the basement membrane into the lamina propria or muscularis mucosae, but no beyond. Esophageal resection specimens were evaluated according to a standardized protocol in which the entire segment of Barrett’s epithelium was sectioned. All resected lymph nodes were evaluated histologically.</p> <p>Time between measurement of index test and reference standard: not specified</p>

Reference	Thomas 2010⁶
Study type	Retrospective series
Study methodology	Data source: Patients with histologically proven high-grade intraepithelial neoplasia or intramucosal carcinoma complicating Barrett's oesophagus referred for further evaluation to one of two tertiary referral centres between March 2003 and September 2008. Recruitment: not specified
Number of patients	n = 50
Patient characteristics	Age, median (range): 69 (60-79) years Gender (male to female ratio): 32/18 Ethnicity: not specified Setting: tertiary referral centre Country: UK Inclusion criteria: patients with histologically proven high-grade intraepithelial neoplasia (HGIN) or intramucosal carcinoma (IMC) complicating Barrett's oesophagus referred for further evaluation to one of two tertiary referral centres. Exclusion criteria: not specified Other characteristics: length of Barrett's oesophagus ranged from 1 to 12 cm (median 4); Pre-EUS histology: n=31 (62%) high grade dysplasia, n=19 (38%) intramucosal carcinoma

Reference	Thomas 2010⁶				
Target condition(s)	T staging (T1m vs T0; T1sm vs T1m and T0); N staging (N1 vs N0)				
Index test(s) and reference standard	<p>All the patients had undergone conventional white light endoscopy and were found to have HGIN or IMC based on Barrett’s surveillance by the referring clinicians. The patients were further evaluated with high-resolution endoscopy using the Olympus Lucera video endoscope system (Olympus KeyMed Ltd., Southend-on-Sea, Essex, UK) and GIF H260 or Q240FZ Olympus gastroscopes followed by EUS assessment for depth of invasion and the presence of regional lymphadenopathy using conventional 7.5- to 20-MHz radial echoendoscopes. Targeted biopsies and/or four quadrant biopsies every 1–2 cm were taken to map the entire Barrett’s segment. Visible lesions were classified according to the Paris classification.</p> <p><u>Index test: EUS</u> All the patients had intravenous sedation with diazepam and pethidine or with midazolam and fentanyl. The patients were assessed by three experienced operators (G. P. Aithal and K. Ragunath in Nottingham, and I. Penman in Edinburgh) using radial EUS (GF-UM2000 or GF-UE260-AL5p (Olympus-Keymed). Endoscopically visible lesions were evaluated using a frequency of 7.5, 10, 12, and/or 20 MHz. The depth of invasion was assessed using a frequency of 20 MHz (mechanical radial scope GFUM2000) and 10 MHz (electronic radial scope GF-UE260- AL5). High-frequency probes were not used for any cases. Submucosal invasion was defined as hypoechoic involvement of the third layer or hypoechoic loss of the interface between the second and third layers on EUS. Lesions were staged based on the tumor node metastasis (TNM) classification. Clinically significant lymphadenopathy was defined as hypoechoic, rounded nodes with clearly defined margins of 10 mm or more.</p> <p><u>Reference standard: Histology (of endoscopically or surgically resected specimens)</u> Endoscopic mucosal resection was performed using either the cap technique (Olympus-Keymed) or the multiband mucosectomy technique (Duette, Cook, UK). The patients referred for surgery underwent conventional esophagectomy by a dedicated oesophageal surgical team. The resected specimens were reviewed by two expert gastrointestinal pathologists for the presence of HGIN or IMC in Barrett’s oesophagus. Nodal positivity on EUS was based on the morphologic appearance of the nodes on EUS and not on fine-needle aspiration (FNA) sampling</p> <p>Time between measurement of index test and reference standard: not specified</p>

1 Appendix H – Review protocols

H21 Review protocol for the clinical and cost effectiveness of endoscopic and radiological staging techniques

3

ID	Field	Content
0.	PROSPERO registration number	CRD42022309286
1.	Review title	The clinical and cost effectiveness of different endoscopic and radiological staging techniques
2.	Review question	For adults with suspected stage 1 carcinoma, what is the clinical and cost effectiveness of different endoscopic and radiological staging techniques?
3.	Objective	To determine which strategy for staging with different endoscopic and radiological techniques is clinically and cost effective.
4.	Searches	<p>The following databases (from inception) will be searched:</p> <ul style="list-style-type: none"> • Cochrane Central Register of Controlled Trials (CENTRAL) • Cochrane Database of Systematic Reviews (CDSR) • Embase • MEDLINE • Epistemonikos <p>Searches will be restricted by:</p> <ul style="list-style-type: none"> • English language studies • Human studies • Letters and comments are excluded

		<p>Other searches:</p> <ul style="list-style-type: none"> • Inclusion lists of systematic reviews will be checked by the reviewers <p>The searches may be re-run 6 weeks before the final committee meeting and further studies retrieved for inclusion if relevant.</p> <p>The full search strategies will be published in the final review.</p> <p>Medline search strategy to be quality assured using the PRESS evidence-based checklist (see methods chapter for full details).</p>
5.	Condition or domain being studied	Barrett's Oesophagus with suspected stage 1 adenocarcinoma
6.	Population	<p>Inclusion:</p> <p>Adults, 18 years and over, with suspected stage 1 adenocarcinoma including those with high grade dysplasia only on biopsies</p> <p>Exclusion: Adults with non-dysplastic Barrett's oesophagus, low grade dysplasia and those with suspected stages higher than stage 1 adenocarcinoma</p>
7.	Intervention	<ul style="list-style-type: none"> • endoscopic staging techniques <ul style="list-style-type: none"> ○ high resolution endoscopy with biopsies ○ Chromoendoscopy (e.g. narrow band imaging) • radiological staging techniques

		<ul style="list-style-type: none"> ○ EUS (endoscopic ultrasound including mini probes) ○ CT ○ CT PET
8.	Comparator	<ul style="list-style-type: none"> ● Within group (e.g. endoscopic staging technique vs. endoscopic staging technique) ● Each other (e.g. endoscopic staging technique vs. radiological staging technique) ●
9.	Types of study to be included	<ul style="list-style-type: none"> ● RCT ● Systematic Reviews <p>Published NMAs and IPDs will be considered for inclusion.</p>
10.	Other exclusion criteria	<p>Non-English language studies.</p> <p>Cohort studies</p> <p>Before and after studies</p> <p>Conference abstracts will be excluded as it is expected there will be sufficient full text published studies available.</p>
11.	Context	<p>In people with suspected stage 1 adenocarcinoma, different endoscopic and radiological techniques are used for staging. This review aims to assess the clinical and cost effectiveness of the different techniques</p>
12.	Primary outcomes (critical outcomes)	<p>All outcomes are considered equally important for decision making and therefore have all been rated as critical:</p> <ul style="list-style-type: none"> ● Health related quality of life ● Progression to higher stage of cancer ● Mortality ● Adverse events (staging perforation, bleeding, pain, allergic reaction to contrast + complications of oesophagectomy) <p>Time point: any time point available; no minimum follow-up</p>

14.	Data extraction (selection and coding)	<p>All references identified by the searches and from other sources will be uploaded into EPPI reviewer and de-duplicated.</p> <p>This review will make use of the priority screening functionality within the EPPI-reviewer software.</p> <p>10% of the abstracts will be reviewed by two reviewers, with any disagreements resolved by discussion or, if necessary, a third independent reviewer.</p> <p>The full text of potentially eligible studies will be retrieved and will be assessed in line with the criteria outlined above.</p> <p>A standardised form will be used to extract data from studies (see Developing NICE guidelines: the manual section 6.4).</p> <p>10% of all evidence reviews are quality assured by a senior research fellow. This includes checking:</p> <ul style="list-style-type: none"> • papers were included /excluded appropriately • a sample of the data extractions • correct methods are used to synthesise data • a sample of the risk of bias assessments <p>Disagreements between the review authors over the risk of bias in particular studies will be resolved by discussion, with involvement of a third review author where necessary.</p> <p>Study investigators may be contacted for missing data where time and resources allow.</p>
15.	Risk of bias (quality) assessment	<p>Risk of bias will be assessed using the appropriate checklist as described in Developing NICE guidelines: the manual.</p> <p>For Intervention reviews the following checklist will be used according to study design being assessed:</p> <p>Systematic reviews: Risk of Bias in Systematic Reviews (ROBIS)</p> <p>Randomised Controlled Trial: Cochrane RoB (2.0)</p> <p>Case control study: CASP case control checklist</p>
16.	Strategy for data synthesis	<p>Where available, outcome data from new studies will be meta-analysed.</p>

		<p>Pairwise meta-analyses will be performed using Cochrane Review Manager (RevMan5). Fixed-effects (Mantel-Haenszel) techniques will be used to calculate risk ratios for the binary outcomes where possible. Continuous outcomes will be analysed using an inverse variance method for pooling weighted mean differences.</p> <p>Heterogeneity between the studies in effect measures will be assessed using the I^2 statistic and visually inspected. An I^2 value greater than 50% will be considered indicative of substantial heterogeneity. Sensitivity analyses will be conducted based on pre-specified subgroups using stratified meta-analysis to explore the heterogeneity in effect estimates. If this does not explain the heterogeneity, the results will be presented pooled using random-effects.</p> <p>GRADEpro will be used to assess the quality of evidence for each outcome, taking into account individual study quality and the meta-analysis results. The 4 main quality elements (risk of bias, indirectness, inconsistency and imprecision) will be appraised for each outcome. Publication bias is tested for when there are more than 5 studies for an outcome.</p> <p>The risk of bias across all available evidence was evaluated for each outcome using an adaptation of the 'Grading of Recommendations Assessment, Development and Evaluation (GRADE) toolbox' developed by the international GRADE working group http://www.gradeworkinggroup.org/</p> <p>Where meta-analysis is not possible, data will be presented, and quality assessed individually per outcome.</p> <p>If sufficient data is available, WinBUGS will be used for network meta-analysis, if possible, given the data identified.</p>
17.	Analysis of sub-groups	<p>Stratification:</p> <p>T1a vs. T1b</p> <p>Subgrouping:</p> <p>If serious or very serious heterogeneity ($I^2 > 50\%$) is present, sub-grouping will occur according to the following strategies: none</p>

26.	Funding sources/sponsor	This systematic review is being completed by the National Guideline Centre which receives funding from NICE.		

27.	Conflicts of interest	All guideline committee members and anyone who has direct input into NICE guidelines (including the evidence review team and expert witnesses) must declare any potential conflicts of interest in line with NICE's code of practice for declaring and dealing with conflicts of interest. Any relevant interests, or changes to interests, will also be declared publicly at the start of each guideline committee meeting. Before each meeting, any potential conflicts of interest will be considered by the guideline committee Chair and a senior member of the development team. Any decisions to exclude a person from all or part of a meeting will be documented. Any changes to a member's declaration of interests will be recorded in the minutes of the meeting. Declarations of interests will be published with the final guideline.	
28.	Collaborators	Development of this systematic review will be overseen by an advisory committee who will use the review to inform the development of evidence-based recommendations in line with section 3 of Developing NICE guidelines: the manual . Members of the guideline committee are available on the NICE website: [NICE guideline webpage] .	
29.	Other registration details

H22 Health economic review protocol

Review question	All questions – health economic evidence
Objectives	To identify health economic studies relevant to any of the review questions.
Search criteria	<ul style="list-style-type: none"> • Populations, interventions and comparators must be as specified in the clinical review protocol above. • Studies must be of a relevant health economic study design (cost–utility analysis, cost-effectiveness analysis, cost–benefit analysis, cost–consequences analysis, comparative cost analysis). • Studies must not be a letter, editorial or commentary, or a review of health economic evaluations. (Recent reviews will be ordered although not reviewed. The bibliographies will be checked for relevant studies, which will then be ordered.) • Unpublished reports will not be considered unless submitted as part of a call for evidence. • Studies must be in English.
Search strategy	A health economic study search will be undertaken for all years using population-specific terms and a health economic study filter – see appendix B below.
Review strategy	<p>Studies not meeting any of the search criteria above will be excluded. Studies published before 2006, abstract-only studies and studies from non-OECD countries or the USA will also be excluded.</p> <p>Studies published in 2006 or later, that were included in the previous guidelines, will be reassessed for inclusion and may be included or selectively excluded based on their relevance to the questions covered in this update and whether more applicable evidence is also identified.</p> <p>Each remaining study will be assessed for applicability and methodological limitations using the NICE economic evaluation checklist which can be found in appendix H of Developing NICE guidelines: the manual (2014).²</p>

Inclusion and exclusion criteria

- If a study is rated as both 'Directly applicable' and with 'Minor limitations' then it will be included in the guideline. A health economic evidence table will be completed and it will be included in the health economic evidence profile.
- If a study is rated as either 'Not applicable' or with 'Very serious limitations' then it will usually be excluded from the guideline. If it is excluded then a health economic evidence table will not be completed and it will not be included in the health economic evidence profile.
- If a study is rated as 'Partially applicable', with 'Potentially serious limitations' or both then there is discretion over whether it should be included.

Where there is discretion

The health economist will make a decision based on the relative applicability and quality of the available evidence for that question, in discussion with the guideline committee if required. The ultimate aim is to include health economic studies that are helpful for decision-making in the context of the guideline and the current NHS setting. If several studies are considered of sufficiently high applicability and methodological quality that they could all be included, then the health economist, in discussion with the committee if required, may decide to include only the most applicable studies and to selectively exclude the remaining studies. All studies excluded on the basis of applicability or methodological limitations will be listed with explanation in the excluded health economic studies appendix below.

The health economist will be guided by the following hierarchies.

Setting:

- UK NHS (most applicable).
- OECD countries with predominantly public health insurance systems (for example, France, Germany, Sweden).
- OECD countries with predominantly private health insurance systems (for example, Switzerland).
- Studies set in non-OECD countries or in the USA will be excluded before being assessed for applicability and methodological limitations.

Health economic study type:

- Cost–utility analysis (most applicable).
- Other type of full economic evaluation (cost–benefit analysis, cost-effectiveness analysis, cost–consequences analysis).
- Comparative cost analysis.

- Non-comparative cost analyses including cost-of-illness studies will be excluded before being assessed for applicability and methodological limitations.

Year of analysis:

- The more recent the study, the more applicable it will be.
- Studies published in 2006 or later (including any such studies included in the previous guidelines) but that depend on unit costs and resource data entirely or predominantly from before 2006 will be rated as 'Not applicable'.
- Studies published before 2006 (including any such studies included in the previous guidelines) will be excluded before being assessed for applicability and methodological limitations.

Quality and relevance of effectiveness data used in the health economic analysis:

- The more closely the clinical effectiveness data used in the health economic analysis match with the outcomes of the studies included in the clinical review the more useful the analysis will be for decision-making in the guideline.

2

Appendix I – Literature search strategies

The literature searches for this review are detailed below and complied with the methodology outlined in Developing NICE guidelines: the manual. ²

For more information, please see the Methodology review published as part of the accompanying documents for this guideline.

Clinical search literature search strategy

Searches were constructed using a PICO framework where population (P) terms were combined with Intervention (I) and in some cases Comparison (C) terms. Outcomes (O) are rarely used in search strategies as these concepts may not be indexed or described in the title or abstract and are therefore difficult to retrieve. Search filters were applied to the search where appropriate.

Table 10: Database parameters, filters and limits applied

Database	Dates searched	Search filter used
Medline (OVID)	1946 – 28 April 2022	Randomised controlled trials Systematic review studies Exclusions (animal studies, letters, comments, editorials, case studies/reports) English language
Embase (OVID)	1974 – 28 April 2022	Randomised controlled trials Systematic review studies Exclusions (animal studies, letters, comments, editorials, case studies/reports, conference abstracts) English language
The Cochrane Library (Wiley)	Cochrane Database of Systematic Reviews to Issue 4 of 12, April 2022 Cochrane Central Register of Controlled Trials to Issue 4 of 12, April 2022	Exclusions (clinical trials, conference abstracts)
Epistemonikos (The Epistemonikos Foundation)	Inception to 28 April 2022	Systematic review Exclusions (Cochrane reviews)

Health Economics literature search strategy

Health economic evidence was identified by conducting searches using terms for a broad Barrett's Oesophagus population. The following databases were searched: NHS Economic Evaluation Database (NHS EED - this ceased to be updated after 31st March 2015), Health Technology Assessment database (HTA - this ceased to be updated from 31st March 2018) and The International Network of Agencies for Health Technology Assessment (INAHTA). Searches for recent evidence were run on Medline and Embase from 2014 onwards for health economics, and all years for quality-of-life studies.

Table 11: Database parameters, filters and limits applied

Database	Dates searched	Search filters and limits applied
Medline (OVID)	Health Economics 1 January 2014 – 29 April 2022	Health economics studies Quality of life studies
	Quality of Life 1946 – 29 April 2022	Exclusions (animal studies, letters, comments, editorials, case studies/reports) English language
Embase (OVID)	Health Economics 1 January 2014 – 29 April 2022	Health economics studies Quality of life studies
	Quality of Life 1974 – 29 April 2022	Exclusions (animal studies, letters, comments, editorials, case studies/reports, conference abstracts) English language
NHS Economic Evaluation Database (NHS EED) (Centre for Research and Dissemination - CRD)	Inception –31st March 2015	
Health Technology Assessment Database (HTA) (Centre for Research and Dissemination – CRD)	Inception – 31st March 2018	
The International Network of Agencies for Health Technology Assessment (INAHTA)	Inception - 29 April 2022	English language

Figure 6: Flow chart of clinical study selection for the review of clinical and cost-effectiveness of endoscopic and radiological staging techniques

Appendix K – Economic evidence study selection

* Non-relevant population, intervention, comparison, design or setting; non-English language

** One article identified was applicable to Q4.1 and Q4.2, for the purposes of this diagram they have been included under Q4.1 only.

Appendix L – Excluded studies

Clinical studies

Table 12: Studies excluded from the clinical review

Study	Reason for exclusion
Borovicka, J., Fischer, J., Neuweiler, J. et al. (2006) Autofluorescence endoscopy in surveillance of Barrett's esophagus: a multicenter randomized trial on diagnostic efficacy. <i>Endoscopy</i> 38(9): 867-72	- Population not relevant to this review protocol <i>The majority had non-dysplastic Barrett's oesophagus</i>
Canto, M. I., Anandasabapathy, S., Brugge, W. et al. (2014) In vivo endomicroscopy improves detection of Barrett's esophagus-related neoplasia: a multicenter international randomized controlled trial (with video). <i>Gastrointestinal Endoscopy</i> 79(2): 211-21	- No relevant outcomes <i>partially incorrect outcome: detection of neoplasia including high grade dysplasia or cancer (stage not specified); incorrect population: only 24% had suspected or confirmed neoplasia at study entry and it is unclear if that was stage 1.</i>
Chen, Y. Q.; Wang, G. M.; Zhang, H. M. (2013) Endoscopic acetic acid-Lugol's iodine double staining for diagnosis of early esophageal cancer. <i>World Chinese Journal of Digestology</i> 21(20): 1972-1976	- Full text paper not available
Curvers, W. L., van Vilsteren, F. G., Baak, L. C. et al. (2011) Endoscopic trimodal imaging versus standard video endoscopy for detection of early Barrett's neoplasia: a multicenter, randomized, crossover study in general practice. <i>Gastrointestinal Endoscopy</i> 73(2): 195-203	- No relevant outcomes
Hedenstrom, P., Marschall, H. U., Nilsson, B. et al. (2018) High clinical impact and diagnostic accuracy of EUS-guided biopsy sampling of subepithelial lesions: a prospective, comparative study. <i>Surgical Endoscopy</i> 32(3): 1304-1313	- No relevant outcomes <i>examining the malignancy of lesions not limited to the oesophagus</i>
Hoffman, A., Gotz, M., Vieth, M. et al. (2007) Confocal endomicroscopy in comparison with acetic acid support magnification endoscopy by Barrett's oesophagus - a randomised, prospective study with a cross-over design. <i>Zeitschrift fur Gastroenterologie</i> 45(8): 775	- Full text paper not available
Jiang, L., Gao, K., Zheng, J. et al. (2010) A randomized controlled trial of preoperative	- Study not reported in English

Study	Reason for exclusion
assessment of esophageal carcinoma with multi-slice computer tomography and mini-probe endoscopic ultrasonography in the selection of surgical programs. Chinese Journal of Clinical Oncology 37(22): 1300-1303	
Kara, M. A., Peters, F. P., Ten Kate, F. J. W. et al. (2005) Endoscopic video autofluorescence imaging may improve the detection of early neoplasia in patients with Barrett's esophagus. Gastrointestinal Endoscopy 61(6): 679-685	- Population not relevant to this review protocol <i>Mixed population of people referred for endoscopy due to regular surveillance (non-dysplastic Barrett's), evaluation of newly diagnosed high-grade dysplasia or oesophageal carcinoma or follow-up after endoscopic treatment of high-grade dysplasia or carcinoma; outcome was detection of high-grade dysplasia and carcinoma</i>
Kara, M. A., Smits, M. E., Rosmolen, W. D. et al. (2005) A randomized crossover study comparing light-induced fluorescence endoscopy with standard videoendoscopy for the detection of early neoplasia in Barrett's esophagus. Gastrointestinal Endoscopy 61(6): 671-8	- Population not relevant to this review protocol <i>Mixed population of non-dysplastic Barrett's oesophagus, high and low grade dysplasia, indefinite for dysplasia; no relevant outcome: diagnostic accuracy data for detection of high-grade dysplasia/ carcinoma (of unspecified stage)</i>
Matthes, K., Bounds, B. C., Collier, K. et al. (2006) EUS staging of upper GI malignancies: results of a prospective randomized trial. Gastrointestinal Endoscopy 64(4): 496-502	- Population not relevant to this review protocol <i>People with UGI malignancy not all located in the oesophagus; no relevant outcomes</i>
May, A., Gunter, E., Roth, F. et al. (2004) Accuracy of staging in early oesophageal cancer using high resolution endoscopy and high resolution endosonography: a comparative, prospective, and blinded trial. Gut 53(5): 634-40	- Population not relevant to this review protocol <i>includes people with squamous cell carcinoma (19%); suspicion of 'early oesophageal carcinoma' not limited to stage 1</i>
Ono, S., Kawada, K., Dohi, O. et al. (2021) Linked Color Imaging Focused on Neoplasm Detection in the Upper Gastrointestinal Tract : A Randomized Trial. Annals of Internal Medicine 174(1): 18-24	- Population not relevant to this review protocol <i>people with known previous or current cancer of the GI tract; outcome was detection of neoplastic lesions not limited to the oesophagus</i>
Pohl, J., May, A., Rabenstein, T. et al. (2007) Comparison of computed virtual chromoendoscopy and conventional chromoendoscopy with acetic acid for detection of neoplasia in Barrett's esophagus. Endoscopy 39(7): 594-8	- No relevant outcomes <i>diagnostic accuracy data for detection of high-grade dysplasia/early cancer combined (with stage not specified)</i>
Ragunath, K., Krasner, N., Raman, V. S. et al. (2003) A randomized, prospective cross-over	- Population not relevant to this review protocol

Study	Reason for exclusion
trial comparing methylene blue-directed biopsy and conventional random biopsy for detecting intestinal metaplasia and dysplasia in Barrett's esophagus. <i>Endoscopy</i> 35(12): 998-1003	<i>Included people with dysplasia without mucosal abnormalities who were receiving follow up endoscopies and excluded those with nodules or mucosal irregularities suspicious of dysplasia or cancer; no relevant outcomes (diagnostic accuracy data for detection of high-grade dysplasia/cancer (of unspecified stage) combined)</i>
Russell, I. T., Edwards, R. T., Gliddon, A. E. et al. (2013) Cancer of Oesophagus or Gastricus - New Assessment of Technology of Endosonography (COGNATE): report of pragmatic randomised trial. <i>Health Technology Assessment (Winchester, England)</i> 17(39): 1-170	- Population not relevant to this review protocol <i>people with known oesophageal cancer not limited to the oesophagus or related to Barrett's oesophagus and not limited to suspected stage 1</i>
Sharma, P., Hawes, R. H., Bansal, A. et al. (2013) Standard endoscopy with random biopsies versus narrow band imaging targeted biopsies in Barrett's oesophagus: a prospective, international, randomised controlled trial. <i>Gut</i> 62(1): 15-21	- No relevant outcomes <i>diagnostic accuracy data for detection of high-grade dysplasia/cancer (stage not specified)</i>
Siemsen, M., Knigge, U., Jensen, F. et al. (2000) A prospective randomized comparison of radial and curved array endosonography in preoperative staging of oesophageal cancer. <i>Endoscopy</i> 32: a20	- Full text paper not available
Siemsen, M., Svendsen, L. B., Knigge, U. et al. (2003) A prospective randomized comparison of curved array and radial echoendoscopy in patients with esophageal cancer. <i>Gastrointestinal Endoscopy</i> 58(5): 671-6	- Population not relevant to this review protocol <i>people with cancer of the oesophagus or cardia 37% of which was squamous cell carcinoma</i>
Wang, F., Liu, P., Zhao, K. et al. (2016) Magnifying endoscopy combined with narrow-band imaging for targeted biopsy of superficial lesions in esophagus. <i>Chinese Journal of Gastroenterology</i> 21(10): 597-601	- Study not reported in English
Zuo, X. L., Li, Z., Li, C. Q. et al. (2017) Probe-based endomicroscopy for in vivo detection of gastric intestinal metaplasia and neoplasia: a multicenter randomized controlled trial. <i>Endoscopy</i> 49(11): 1033-1042	- Population not relevant to this review protocol <i>People with H pylori infection or gastritis undergoing surveillance for gastric intestinal metaplasia, intraepithelial neoplasia or cancer.</i>

Health Economic studies

Published health economic studies that met the inclusion criteria (relevant population, comparators, economic study design, published 2006 or later and not from non-OECD country or USA) but that were excluded following appraisal of applicability and methodological quality are listed below. See the health economic protocol for more details.

None.
