Health Technology Appraisal

Netarsudil-latanoprost for previously treated open-angle glaucoma or ocular hypertension

Draft scope

**Draft remit/appraisal objective**

To appraise the clinical and cost effectiveness of netarsudil-latanoprost within its marketing authorisation for treating open-angle glaucoma or ocular hypertension.

**Background**

Glaucoma refers to a group of eye conditions characterised by progressive damage to the optic nerve. It can lead to impaired peripheral vision and eventually total loss of sight, if it is not detected and treated early. Glaucoma is usually associated with an increase in pressure within the eye. This can be caused by either the production of too much aqueous humour by the ciliary body or decreased outflow (drainage) of the fluid.

Ocular hypertension (OHT) is the term used to describe elevated intraocular pressure (IOP; that is IOP greater than 21 mmHg) in the absence of optic nerve damage or visual field loss. It can be present for many years without the development of glaucoma, however sustained elevation of IOP causes damage to the optic nerve head and is a major risk factor for the development of glaucoma. Lowering OHT has been shown to lower the risk of developing glaucoma.

Primary, or chronic, open-angle glaucoma (COAG) accounts for over 70% of all glaucoma cases<sup>1</sup>. It develops slowly over many years and doesn't cause any noticeable symptoms until irreversible damage has occurred to the optic nerve. The peripheral vision is affected first, and without treatment, central vision may also be lost resulting in loss of visual acuity.

Open-angle glaucoma had an estimated UK prevalence in 2017 of approximately 2% of people over the age of 40 years<sup>2,3</sup>. Using the 2019 ONS population projections<sup>4</sup> this would be more than approximately 660,000 in the UK. The overall risk of developing open-angle glaucoma increases substantially with increasing IOP and with age. OHT is estimated to affect 3-5% of people over the age of 40 years (2015 prevalence), which could be over 1 million people in England<sup>4</sup>. However, the number of people requiring treatment is expected to be much lower than this.

NICE's guidance on the diagnosis and management of glaucoma (NG81) recommends a generic prostaglandin analogue for people with IOP of 24 mmHg or more if they are at risk of visual impairment within their lifetime. For those who cannot tolerate their current treatment, an alternative generic prostaglandin analogue should be offered, and if this is not tolerated, a beta-blocker. If none of these options are tolerated (or not reducing IOP sufficiently), non-generic prostaglandin analogues, carbonic anhydrase inhibitors, sympathomimetics, miotics or a combination of treatments should be offered. People whose IOP cannot be reduced sufficiently with pharmacological treatment should be referred to a consultant ophthalmologist to discuss other options.

Draft scope for the appraisal of netarsudil and latanoprost for previously treated open-angle glaucoma or ocular hypertension. Issue Date: October 2021

A generic prostaglandin analogue is offered to people with confirmed COAG. For people with advanced COAG, surgery with pharmacological augmentation is offered (with interim treatment with a generic prostaglandin analogue while listed for surgery). If adherence and eye drop instillation technique are satisfactory but IOP has not been reduced sufficiently to prevent the risk of progression to sight loss despite pharmacological treatment, or the drug is not tolerated, a drug from another therapeutic class can be offered (beta-blocker, carbonic anhydrase inhibitor or sympathomimetic), and topical drugs from different therapeutic classes may be needed at the same time to control IOP. Alternatively, laser trabeculoplasty or trabecular stent bypass microsurgery with pharmacological augmentation can be offered.

**The technology**

Netarsudil-latanoprost (Roclanda, Aerie Pharmaceuticals) is an eye drop that combines in a fixed dose of netarsudil 0.02% (Rhokiinsa, Aerie Pharmaceuticals) with latanoprost 0.005%. Netarsudil inhibits both Rho kinase and the norepinephrine transporter which increases fluid outflow and reduces fluid inflow. Latanoprost ophthalmic solution is a prostaglandin analogue that works by increasing the outflow of aqueous fluid from the eyes. Netarsudil-latanoprost is administered topically into the eyes<sup>3</sup>.

Netarsudil-latanoprost has a marketing authorisation for the reduction of elevated IOP in adult patients with primary open-angle glaucoma or ocular hypertension for whom monotherapy with a prostaglandin or netarsudil provides insufficient IOP reduction.

<b>Intervention(s)</b>	Netarsudil-latanoprost
<b>Population(s)</b>	People with previously treated open-angle glaucoma or ocular hypertension
<b>Comparators</b>	<ul style="list-style-type: none"> <li>• Topical (eye drops), monotherapy or in combination:             <ul style="list-style-type: none"> <li>○ Prostaglandin analogues (for example bimatoprost, latanoprost, tafluprost, travoprost)</li> <li>○ Beta-blockers (for example betaxolol, carteolol hydrochloride, levobunolol hydrochloride, timolol maleate)</li> <li>○ Carbonic anhydrase inhibitors (for example acetazolamide, brinzolamide, dorzolamide)</li> <li>○ Sympathomimetics (for example apraclonidine, brimonidine tartrate)</li> <li>○ Selective laser trabeculoplasty.</li> </ul> </li> <li>• Trabecular stent bypass microsurgery</li> </ul>

<b>Outcomes</b>	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none"> <li>• mean intraocular pressure</li> <li>• visual acuity</li> <li>• visual field test</li> <li>• evaluation of anterior and posterior segment parameters</li> <li>• structural integrity of the optic nerve</li> <li>• adverse effects of treatment</li> <li>• health-related quality of life.</li> </ul>
<b>Economic analysis</b>	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p> <p>Cost effectiveness analysis should include consideration of the benefit in the best and worst seeing eye.</p>
<b>Other considerations</b>	<p>If the evidence allows, consideration will be given to subgroups of people with OHT and people with COAG.</p> <p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>

### Questions for consultation

What does the treatment pathway look like in current NHS practice for open-angle glaucoma or ocular hypertension? Which treatments are considered to be established clinical practice in the NHS for open-angle glaucoma or ocular hypertension in people for whom monotherapy was not effective?

Have all relevant comparators for netarsudil-latanoprost been included in the scope? Should surgical and laser treatments be included as comparators? Is carteolol hydrochloride used in NHS clinical practice?

Are the outcomes listed appropriate?

Are the subgroups suggested in 'other considerations' appropriate? Are there any other subgroups of people in whom netarsudil-latanoprost is expected to be more clinically effective and cost effective or other groups that should be examined separately?

Where do you consider netarsudil-latanoprost will fit into the existing [NICE pathway](#) for glaucoma?

NICE is committed to promoting equality of opportunity, eliminating unlawful discrimination and fostering good relations between people with particular protected characteristics and others. Please let us know if you think that the proposed remit and scope may need changing in order to meet these aims. In particular, please tell us if the proposed remit and scope:

- could exclude from full consideration any people protected by the equality legislation who fall within the patient population for which netarsudil-latanoprost will be licensed;
- could lead to recommendations that have a different impact on people protected by the equality legislation than on the wider population, e.g. by making it more difficult in practice for a specific group to access the technology;
- could have any adverse impact on people with a particular disability or disabilities.

Please tell us what evidence should be obtained to enable the Committee to identify and consider such impacts.

Do you consider netarsudil-latanoprost to be innovative in its potential to make a significant and substantial impact on health-related benefits and how it might improve the way that current need is met (is this a 'step-change' in the management of the condition)?

Do you consider that the use of netarsudil-latanoprost can result in any potential significant and substantial health-related benefits that are unlikely to be included in the QALY calculation?

Please identify the nature of the data which you understand to be available to enable the Appraisal Committee to take account of these benefits.

To help NICE prioritise topics for additional adoption support, do you consider that there will be any barriers to adoption of this technology into practice? If yes, please describe briefly.

NICE intends to appraise this technology through its Single Technology Appraisal (STA) Process. We welcome comments on the appropriateness of appraising this topic through this process. (Information on the Institute's Technology Appraisal processes is available at <http://www.nice.org.uk/article/pmg19/chapter/1-Introduction>).
