

“Corticosteroids for the treatment of Chronic Asthma in children under the age of 12 years”

P64: The adverse effects profiles appear similar for the two drugs, although one study found a statistically significant drop in plasma cortisol levels in the BDP arm (but with absolute values within the normal range), but a similar change was not seen in the **BDP** arm.

? should this be “FP”

P190: This is based on a reported higher potency for FP. In the Cochrane review of FP compared to **BEC** or BUD188 (of which 14 of the 57 included RCTs were in children)

Replace “BEC” with “BDP” to maintain consistency
