

NATIONAL INSTITUTE FOR HEALTH AND CARE EXCELLENCE

Proposed Health Technology Appraisal

Bevacizumab for treating relapsed, platinum-resistant epithelial ovarian, fallopian tube or primary peritoneal cancer

Draft scope (pre-referral)

Draft remit/appraisal objective

To appraise the clinical and cost effectiveness of bevacizumab within its licensed indication for treating relapsed, platinum-resistant epithelial ovarian, fallopian tube or primary peritoneal cancer.

Background

Ovarian cancer includes a group of different tumours that arise from diverse types of tissue contained in the ovary. The most common type of ovarian cancer arises from epithelial cells (the outside layer of cells) on the surface of the ovary, and can often spread from the ovary to any surface within the abdominal cavity including the fallopian tubes and peritoneal cavity. Fallopian tube cancer and primary peritoneal cancer are histologically equivalent diseases to epithelial ovarian cancer. In most cases, ovarian cancer is diagnosed at an advanced stage, when it has spread outside the pelvis into the abdomen and/or metastasised.

The incidence of ovarian cancer increases with age, with over 80% of cases being diagnosed in people over 50 years. In 2012, approximately 6500 people were diagnosed with ovarian cancer or peritoneal cancer in England, and in 2011 there were approximately 3500 deaths from ovarian cancer. The overall 5-year survival rate for ovarian cancer is approximately 43%.

Ovarian cancer may be categorised according to the response to platinum chemotherapy as follows: platinum-sensitive (responds to platinum-based therapy but relapses after 6 months or more); platinum-resistant (relapses within 6 months of completion of platinum-based chemotherapy) and platinum-refractory (does not respond to initial platinum-based chemotherapy). Although a significant percentage of ovarian cancer tumours respond to initial chemotherapy, between 55% and 75% of those tumours that respond relapse within 2 years of completing treatment.

NICE Technology Appraisal 91 recommends paclitaxel and pegylated liposomal doxorubicin hydrochloride (PLDH) as options for the second-line or subsequent treatment of platinum-resistant ovarian cancer. It also recommends topotecan for the second-line or subsequent treatment of platinum-resistant ovarian cancer when paclitaxel and PLDH are considered inappropriate.

The technology

Bevacizumab (Avastin, Roche Products) is a humanised anti-vascular endothelial growth factor (VEGF) monoclonal antibody that reduces vascularisation of tumours, inhibiting tumour growth. It is administered by intravenous infusion.

The European Medicines Agency's Committee for Medicinal Products for Human Use (CHMP) has adopted a positive opinion recommending a variation to the terms of the marketing authorisation for bevacizumab to include bevacizumab in combination with paclitaxel, topotecan or PLDH for treating adult patients with platinum-resistant recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer who received no more than two previous chemotherapy regimens and who have not received previous therapy with bevacizumab or other VEGF inhibitors or VEGF receptor-targeted agents.

Intervention(s)	Bevacizumab in combination with paclitaxel, topotecan or pegylated liposomal doxorubicin hydrochloride
Population(s)	Adults with relapsed, platinum-resistant epithelial ovarian, fallopian tube or primary peritoneal cancer, who have received no more than two previous chemotherapy regimens and who have not received prior therapy with bevacizumab or other VEGF-receptor targeted agents
Comparators	<ul style="list-style-type: none"> • Paclitaxel • Pegylated liposomal doxorubicin hydrochloride • Topotecan (for people whom paclitaxel and pegylated liposomal doxorubicin hydrochloride are not appropriate)
Outcomes	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none"> • overall survival • progression free survival • response rates • adverse effects of treatment • health-related quality of life.

Economic analysis	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p>
Other considerations	<p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>

Questions for consultation

Have all relevant comparators for bevacizumab been included in the scope?

Which treatments are considered to be established clinical practice in the NHS for relapsed, platinum-resistant epithelial ovarian, fallopian tube and primary peritoneal cancer?

Are there any subgroups of people in whom the technology is expected to be more clinically effective and cost effective or other groups that should be examined separately?

Where do you consider bevacizumab will fit into the existing NICE pathway, [Ovarian cancer](#)?

NICE is committed to promoting equality of opportunity, eliminating unlawful discrimination and fostering good relations between people with particular protected characteristics and others. Please let us know if you think that the proposed remit and scope may need changing in order to meet these aims. In particular, please tell us if the proposed remit and scope:

- could exclude from full consideration any people protected by the equality legislation who fall within the patient population for which bevacizumab will be licensed;
- could lead to recommendations that have a different impact on people protected by the equality legislation than on the wider population, e.g. by making it more difficult in practice for a specific group to access the technology;
- could have any adverse impact on people with a particular disability or disabilities.

Please tell us what evidence should be obtained to enable the Committee to identify and consider such impacts.

Do you consider the technology to be innovative in its potential to make a significant and substantial impact on health-related benefits and how it might improve the way that current need is met (is this a 'step-change' in the management of the condition)?

Do you consider that the use of the technology can result in any potential significant and substantial health-related benefits that are unlikely to be included in the QALY calculation?

Please identify the nature of the data which you understand to be available to enable the Appraisal Committee to take account of these benefits.

NICE intends to appraise this technology through its Single Technology Appraisal (STA) Process. We welcome comments on the appropriateness of appraising this topic through this process.
