

Isatuximab with pomalidomide and dexamethasone for treating relapsed and refractory multiple myeloma

Information for the public

Published: 18 November 2020

www.nice.org.uk

Isatuximab (Sarclisa) plus pomalidomide and dexamethasone is available through the [Cancer Drugs Fund](#). It is a possible treatment for relapsed and refractory multiple myeloma in adults who:

- have had 3 previous treatments, including lenalidomide and a proteasome inhibitor, and
- have disease that has progressed during the last treatment.

More evidence on isatuximab plus pomalidomide and dexamethasone is being collected until the final results of the ICARIA-MM study are available. After this, NICE will decide whether or not to recommend it for use on the NHS and update the guidance. It will be available through the Cancer Drugs Fund until then.

If you are not eligible for isatuximab plus pomalidomide and dexamethasone but are already having it, you should be able to continue until you and your doctor decide when best to stop.

Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. Read more about [making decisions about your care](#).

Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

Information and support

The [NHS website](#) may be a good place to find out more.

These organisations can give you advice and support:

- [Myeloma UK](#), 0800 980 3332
