

Apalutamide with androgen deprivation therapy for treating hormone-sensitive metastatic prostate cancer

Information for the public

Published: 28 October 2021

www.nice.org.uk

Apalutamide (Erleada) with androgen deprivation therapy is available on the NHS as a possible treatment for hormone-sensitive metastatic prostate cancer in adults. This is only if you cannot have docetaxel.

If you are not eligible for apalutamide but are already having it, you should be able to continue until you and your doctor decide when best to stop.

Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. Read more about [making decisions about your care](#).

Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

Information and support
