

Tucatinib with trastuzumab and capecitabine for treating HER2-positive advanced breast cancer after 2 or more anti-HER2 therapies

Information for the public

Published: 27 April 2022

www.nice.org.uk

Tucatinib (TUKYSA) with trastuzumab (Herceptin) and capecitabine (Xeloda) is available on the NHS. It is a possible treatment for HER2-positive, locally advanced or metastatic breast cancer that has already been treated with 2 or more anti-HER2 therapies in adults.

Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. Read more about [making decisions about your care](#).

Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?
