

# Asciminib for treating chronic myeloid leukaemia after 2 or more tyrosine kinase inhibitors

Information for the public  
Published: 3 August 2022

[www.nice.org.uk](http://www.nice.org.uk)

Asciminib (Scemblix) is available on the NHS. It is a possible treatment for chronic-phase Philadelphia chromosome-positive chronic myeloid leukaemia in adults who:

- have already had 2 or more treatments called tyrosine kinase inhibitors
- do not have the T315I gene mutation.

## Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. Read more about [making decisions about your care](#).

## Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

## Information and support
