

Sacituzumab govitecan for treating unresectable triple- negative advanced breast cancer after 2 or more therapies

Information for the public

Published: 17 August 2022

www.nice.org.uk

Sacituzumab govitecan (Trodelvy) is available on the NHS. It is a possible treatment for breast cancer in adults if the person has already had 2 or more treatments, at least 1 of which was for advanced cancer, and only if the cancer:

- cannot be removed by surgery (unresectable)
- is triple negative, which means it does not have receptors for oestrogen or progesterone and tests negative for a protein called HER2
- has spread to nearby tissue or lymph nodes (locally advanced) or to other parts of the body (metastatic).

Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. Read more about [making decisions about your care](#).

Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?
