## Health Technology Appraisal

### Capmatinib for treating locally advanced or metastatic non-small-cell lung cancer with METex14 skipping mutations [ID1387]

#### Final scope

#### Remit/appraisal objective

To appraise the clinical and cost effectiveness of capmatinib within its marketing authorisation for treating locally advanced or metastatic non-small-cell lung cancer (NSCLC) with mesenchymal–epithelial transition (MET) exon 14 (METex14) skipping mutations.

#### Background

Lung cancer is the third most common cancer and the most common cause of cancer death in the UK, accounting for 13% of all new cancer cases and 21% of all cancer deaths in 2017.<sup>1</sup> There are around 48,000 new lung cancer cases and 35,000 deaths from lung cancer in the UK every year. Around 85% of lung cancers are NSCLC.<sup>2</sup> Approximately 70% of NSCLC are of non-squamous histology and can be either large-cell undifferentiated carcinoma or adenocarcinoma.<sup>3</sup>

The majority of lung cancers are diagnosed at an advanced stage, when the cancer has spread to lymph nodes and other organs in the chest (locally advanced disease; stage III) or to other parts of the body (metastatic disease; stage IV), and usually cannot be surgically removed. In 2017, 88% (34,591) of people diagnosed with lung cancer had NSCLC in England, Wales, Jersey and Guernsey.<sup>4</sup> For the majority of people with NSCLC, the aims of therapy are to prolong survival and improve quality of life. Treatment choices are influenced by the presence of biological markers (such as the checkpoint inhibitor programmed death-ligand 1 [PD-L1] and mutations in epidermal growth factor receptor-tyrosine kinase [EGFR-TK] or anaplastic-lymphoma-kinase [ALK], or), histology (squamous or non-squamous) and previous treatment experience. There are specific NICE treatment pathways for cancers positive for EGFR-TK, ALK or ROS-1 gene mutations but not for METex14 skipping mutations.

METex14 skipping mutations occur in approximately 3 to 4% of patients with NSCLC, typically in the absence of other driver mutations and are associated with poor prognosis.<sup>5</sup>

For previously untreated, metastatic, non-squamous NSCLC if the tumours express PD-L1 with a tumour proportion score (TPS) between 0% and 49%, NICE guideline 122 recommends platinum-based chemotherapy (that is, cisplatin or carboplatin and either docetaxel, gemcitabine, paclitaxel, or vinorelbine). NICE technology appraisal 683 recommends pembrolizumab with pemetrexed and platinum chemotherapy. NICE technology appraisal 584 recommends atezolizumab plus bevacizumab, carboplatin, and paclitaxel. Alternatively, people may receive pemetrexed in combination with cisplatin if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma (NICE technology appraisal guidance 181).

People with metastatic, non-squamous NSCLC with PD-L1 <50% whose disease progress after initial treatment with platinum-based chemotherapy can receive chemotherapy with docetaxel and the multikinase inhibitor nintedanib (TA347), atezolizumab (TA520), nivolumab (TA713), or pembrolizumab (TA428). People whose disease progress after treatment with pembrolizumab combination (TA683) or atezolizumab combination (TA584) can receive docetaxel with or without nintedanib (TA347).

For previously untreated, metastatic, non-squamous NSCLC if the tumours express PD-L1 TPS  $\geq$ 50%, NICE guideline 122 recommends pembrolizumab monotherapy (TA531), atezolizumab monotherapy (TA705), or pembrolizumab with pemetrexed and platinum chemotherapy (TA683). If the disease progresses following pembrolizumab or atezolizumab monotherapy, NICE guideline 122 recommends platinum doublet (TA181) or pemetrexed with carboplatin. If the disease progresses following pembrolizumab combination (TA683), docetaxel with or without nintedanib (TA347) is recommended.

For previously untreated, metastatic, squamous NSCLC if the tumours express PD-L1 with TPS between 0% and 49%, NICE guideline 122 recommends platinum-based chemotherapy (that is, gemcitabine or vinorelbine with carboplatin or cisplatin) or pembrolizumab with carboplatin and paclitaxel (TA600). If the disease progresses, people can be offered docetaxel, atezolizumab (TA520), nivolumab (TA655), or pembrolizumab (TA428).

People with metastatic, squamous NSCLC with PD-L1 TPS  $\geq$ 50%, NICE technology appraisal 531 recommends pembrolizumab monotherapy, technology appraisal 705 recommends atezolizumab monotherapy, and technology appraisal 600 recommends pembrolizumab with carboplatin and paclitaxel. If disease progresses after pembrolizumab or atezolizumab monotherapy, NICE guideline 122 recommends gemcitabine or vinorelbine with carboplatin or cisplatin. If disease progresses after pembrolizumab combination, NICE guideline 122 recommends docetaxel. There is currently no NICE guidance specific to the population with METex14 skipping mutations.

### **The technology**

Capmatinib (Tabrecta, Novartis) is an orally bioavailable inhibitor of the proto-oncogene cMet (hepatocyte growth factor receptor [HGFR]) with potential antineoplastic activity. Capmatinib is a small molecule kinase inhibitor targeted against c-Met, a receptor tyrosine kinase that, in healthy humans, activates signalling cascades involved in organ regeneration and tissue repair. Aberrant c-Met activation, via mutations, amplification, and/or overexpression, is known to occur in many types of cancer, and leads to overactivation of multiple downstream signalling pathways. It is administered orally.

Capmatinib does not currently have a marketing authorisation in the UK for treating people with locally advanced or metastatic NSCLC with a METex14 skipping mutations. It is being studied in a non-randomised Phase II trial of 368 adults with stage IIIB or stage IV NSCLC with MET alterations.

<b>Intervention(s)</b>	Capmatinib
<b>Population(s)</b>	Adults with locally advanced or metastatic NSCLC with METex14 skipping mutations
<b>Comparators</b>	<p><b>Untreated disease:</b></p> <p>For people with non-squamous NSCLC whose tumours express PD-L1 with at least a 50% tumour proportion score:</p> <ul style="list-style-type: none"> <li>• Pembrolizumab monotherapy</li> <li>• Pembrolizumab combination with pemetrexed and platinum chemotherapy</li> <li>• Atezolizumab monotherapy</li> <li>• Tepotinib monotherapy (subject to ongoing appraisal ID3761)</li> </ul> <p>For people with non-squamous NSCLC whose tumours express PD-L1 with a tumour proportion score below 50%:</p> <ul style="list-style-type: none"> <li>• Pembrolizumab combination with pemetrexed and platinum chemotherapy</li> <li>• Atezolizumab plus bevacizumab, carboplatin and paclitaxel</li> <li>• Chemotherapy (docetaxel, gemcitabine, paclitaxel or vinorelbine) in combination with a platinum drug (carboplatin or cisplatin) <ul style="list-style-type: none"> <li>○ with or without pemetrexed maintenance treatment</li> </ul> </li> <li>• Tepotinib monotherapy (subject to ongoing appraisal ID3761)</li> </ul> <p>For people with adenocarcinoma or large-cell carcinoma whose tumours express PD-L1 with a tumour proportion score below 50%:</p> <ul style="list-style-type: none"> <li>• Pemetrexed in combination with a platinum drug (carboplatin or cisplatin) <ul style="list-style-type: none"> <li>○ with (following cisplatin-containing regimens only) or without pemetrexed maintenance treatment</li> </ul> </li> </ul> <p>For people with squamous NSCLC whose tumours express PD-L1 with at least a 50% tumour proportion score:</p> <ul style="list-style-type: none"> <li>• Pembrolizumab monotherapy</li> <li>• Pembrolizumab with carboplatin and paclitaxel (subject to ongoing appraisal ID1683)</li> <li>• Atezolizumab monotherapy</li> <li>• Tepotinib monotherapy (subject to ongoing appraisal</li> </ul>

ID3761)

For people with squamous NSCLC whose tumours express PD-L1 with a tumour proportion score below 50%:

- Chemotherapy (gemcitabine or vinorelbine) in combination with a platinum drug (carboplatin or cisplatin)
- Pembrolizumab with carboplatin and paclitaxel (subject to ongoing appraisal ID1683)
- Tepotinib monotherapy (subject to ongoing appraisal ID3761)

**For previously treated disease:**

For people with non-squamous NSCLC whose tumours express PD-L1 with at least a 50% tumour proportion score:

- Platinum doublet
- Pemetrexed with carboplatin
- Docetaxel, with (for adenocarcinoma histology) or without nintedanib
- Tepotinib monotherapy (subject to ongoing appraisal ID3761)
- Best supportive care

For people with non-squamous NSCLC whose tumours express PD-L1 with a tumour proportion score below 50%:

- Atezolizumab monotherapy
- Pembrolizumab monotherapy (PD-L1 positive)
- Nivolumab monotherapy (PD-L1 positive)
- Docetaxel, with (for adenocarcinoma histology) or without nintedanib
- Tepotinib monotherapy (subject to ongoing appraisal ID3761)
- Best supportive care

For people with squamous NSCLC whose tumours express PD-L1 with a tumour proportion score below 50%:

- Atezolizumab monotherapy
- Nivolumab monotherapy
- Pembrolizumab monotherapy (PD-L1 positive)
- Docetaxel
- Tepotinib monotherapy (subject to ongoing appraisal ID3761)

	<ul style="list-style-type: none"> <li>• Best supportive care</li> </ul> <p>For people with squamous NSCLC whose tumours express PD-L1 with at least a 50% tumour proportion score:</p> <ul style="list-style-type: none"> <li>• Gemcitabine with carboplatin or cisplatin</li> <li>• Vinorelbine with carboplatin or cisplatin</li> <li>• Docetaxel</li> <li>• Tepotinib monotherapy (subject to ongoing appraisal ID3761)</li> <li>• Best supportive care</li> </ul>
<b>Outcomes</b>	<p>The outcome measures to be considered include:</p> <ul style="list-style-type: none"> <li>• overall survival</li> <li>• progression free survival</li> <li>• response rate</li> <li>• time to treatment discontinuation</li> <li>• adverse effects of treatment</li> <li>• health-related quality of life.</li> </ul>
<b>Economic analysis</b>	<p>The reference case stipulates that the cost effectiveness of treatments should be expressed in terms of incremental cost per quality-adjusted life year.</p> <p>The reference case stipulates that the time horizon for estimating clinical and cost effectiveness should be sufficiently long to reflect any differences in costs or outcomes between the technologies being compared.</p> <p>Costs will be considered from an NHS and Personal Social Services perspective.</p> <p>The availability of any commercial arrangements for the intervention, comparator and subsequent treatment technologies will be taken into account. The availability of any managed access arrangement for the intervention will be taken into account.</p> <p>The use of capmatinib in NSCLC is conditional on the presence of METex14 skipping mutations. The economic modelling should include the costs associated with diagnostic testing for METex14 skipping mutations in people with advanced non-small-cell lung cancer who would not otherwise have been tested. A sensitivity analysis should be provided without the cost of the diagnostic test. <a href="#">See section 5.9 of the Guide to the Methods of Technology Appraisals.</a></p>

<p><b>Other considerations</b></p>	<p>If evidence allows, subgroup analysis by</p> <ul style="list-style-type: none"> <li>• Previous therapy</li> <li>• Squamous versus non-squamous status</li> <li>• Level of PD-L1 expression</li> </ul> <p>The availability and cost of biosimilar and generic products should be taken into account.</p> <p>Guidance will only be issued in accordance with the marketing authorisation. Where the wording of the therapeutic indication does not include specific treatment combinations, guidance will be issued only in the context of the evidence that has underpinned the marketing authorisation granted by the regulator.</p>
