

Ivosidenib for treating advanced cholangiocarcinoma with an IDH1 R132 mutation after 1 or more systemic treatments

Information for the public

Published: 31 January 2024

www.nice.org.uk

Ivosidenib (Tibsovo) is available on the NHS. It is a possible treatment for locally advanced or metastatic cholangiocarcinoma (bile duct cancer) with an IDH1 R132 mutation in adults after 1 or more systemic treatments. Systemic treatments work throughout the whole body. They can include injections, infusions or medicines taken by mouth.

Is this treatment right for me?

Your healthcare professionals should give you clear information, talk with you about your options and listen carefully to your views and concerns. Your family can be involved too, if you wish. See [our webpage on making decisions about your care](#).

Questions to think about

- How well does it work compared with other treatments?
- What are the risks or side effects? How likely are they?
- How will the treatment affect my day-to-day life?
- What happens if the treatment does not work?
- What happens if I do not want to have treatment? Are there other treatments available?

Information and support

The [NHS webpage on bile duct cancer \(cholangiocarcinoma\)](#) may be a good place to find out more.
