

Bipolar, schizophrenia and other psychoses: care planning

NICE indicator Published: 3 August 2015 Last updated: 4 November 2020

www.nice.org.uk/indicators/ind143

Indicator

The percentage of patients with schizophrenia, bipolar affective disorder and other psychoses who have a comprehensive care plan documented in the record, in the preceding 12 months, agreed between individuals, their family and/or carers as applicable.

Indicator type

General practice indicator suitable for use in the Quality and Outcomes Framework.

This document does not represent formal NICE guidance. For a full list of NICE indicators, see our <u>menu of indicators</u>.

To find out how to use indicators and how we develop them, see our <u>NICE indicator</u> <u>process guide</u>.

Rationale

This indicator supports the coordinated delivery of health care services for people with schizophrenia, bipolar disorder or other psychoses. Between 18-30% of people with severe mental illness in the UK are described as being seen only in a primary care setting so it is important that practices take responsibility for discussing and documenting care plans for these people in their care record (<u>Reilly et al. 2012</u>). Care plans should include a crisis plan, medication plan and individualised recovery goals.

Source guidance

- <u>Psychosis and schizophrenia in adults: prevention and management. NICE guideline</u> <u>CG178</u> (2014), recommendations 1.3.3.5 and 1.5.3.6
- <u>Bipolar disorder: assessment and management. NICE guideline CG185</u> (2014), recommendations 1.2.4, 1.3.4 and 1.9.4

Specification

Numerator: The number of patients in the denominator who have an agreed comprehensive care plan documented in their record (recorded in the preceding 12 months).

Denominator: The number of patients with schizophrenia, bipolar disorder or other psychoses.

Calculation: Numerator divided by the denominator, multiplied by 100.

Exclusions:

- Care plans dated prior to a date of relapse should not be included.
- A care plan should be updated on relapse if the patient has been previously recorded as in remission.

Minimum population: The indicator would be appropriate to assess performance at individual general practice level.
